## INTRODUCTION

The Air Force Office of Scientific Research Technical Report Summaries is published quarterly (March, June, September, and December). It contains a brief summary of each technical report received in the Technical Information Division and submitted to the Defense Technical Information Center (DTIC) for that quarter. Three indexes, subject, personal author and title are provided to help the user locate reports that may be of interest.

AFOSR does not maintain copies of technical reports for distribution. However, you may obtain any of these reports if you are registered with DTIC, by requesting the AD number of that report from the DTIC, Cameron Station, Alexandria, Virginia, 22314.

## PURPOSE

The purpose of this report is to inform Air Force Laboratories about the science that the Air Force Office of Scientific Research is supporting.

## AFOSR MISSION

The Air Force Office of Scientific Research (AFOSR) is the Single Manager of the Air Force Defense Research Sciences Program (Program Element 61102F) and the primary Air Force agency for the extramural support of fundamental scientific research. The AFOSR is organized under the Air Force Systems Command, DCS/Technology.

AFOSR awards grants and contracts for research in areas of science relevant to the needs of the Air Force. Research is selected for support from proposals received in response to the Broad Agency Announcement originating from scientists investigating problems involving the search for new knowledge and the expansion of scientific principles. Selection is on the basis of scientific potential for improving Air Force operational capabilities, originality, significance to science, the qualification of the principal investigators, and the reasonableness of the proposed budget.

### KEY TO READING THE DATA

The summaries consist of three indexes and the abstracts. From one of the indexes, locate the AD number of the report that is of interest to you. Use this number to locate the abstract of the report in the abstracts section. The first report submitted to DTIC during the quarter (the one with the lowest AD number) appears on the last page of the abstracts section. The last report submitted to DTIC during the quarter (the one with the highest DTIC number) appears on the first page of the abstracts section. The following terms will give you a brief description of the elements used in each summary of this report.

DTIC Report Bibliography - DTIC's brief description of a technical report.

Search Control Number - A number assigned by DTIC at the time a bibliography is printed.

AD Number - A number assigned to each technical report when received by the DTIC.

Field & Group Numbers - (appearing after the AD number) First number is the subject field, and the second number is the particular group under that subject field.

Corporate Author/Performing Organization - The organization; e.g., college/university, company, etc., at which the research is conducted.

Title - The title of the technical report.

Descriptive Note - Gives the type of report; e.g., final, interim, etc., and the period of the time of the research.

Date - Date of the technical report.

Pages - Total number of pages contained in the technical report.

Personal Author - Person or persons who wrote the report.

Contract/Grant Number - The instrument control number identifying the contracting activity and funding year under which the research is initiated.

Project Number - A number unique to a particular area of science; e.g., 2304 is the project number for mathematics.

**Task Number** - An alphanumeric number unique to a specific field of the main area of science; e.g., 2304 is the project number for mathematics and A3 is the task number for computational sciences.

**Monitor Number** - The number assigned to a particular report by the government agency monitoring the research. The number consists of the government monitor acronym, the present calendar year and the technical report assigned consecutively; e.g., AFOSR-TR-83-0001 is the first number used for the first technical report processed for Calendar Year 1983.

**Supplementary Note** - A variety of statements pertaining to a report. For example, if the report is a journal article, the supplementary note might give you the journal citation, which will include the name of the journal the article it appears in, and the volume number, date, and the page numbers of the journal.

**Abstract** - A brief summary describing the research of the report.

**Descriptors** - Key words describing the research.

**Identifiers** - Commonly used designators, such as names of equipment, names of projects or acronyms, the AFOSR project and task number, and the Air Force Research Program Element number.

## SUBJECT INDEX

- \*ACCELERATION  
Reprint: Particle Acceleration  
by Electromagnetic Ion Cyclotron  
Turbulence.  
AD-A228 838
- \*ACCESS  
Reprint: The Access and Use of  
Relevant Information: A Specific  
Case and General Issues.  
AD-A228 753
- \*ACETYLCHOLINESTERASE  
Acetylcholinesterase Chirality  
and Cellular Mechanisms of  
Organophosphonate Toxicity.\*  
AD-A224 981  
Xenobiotic Kinetics and Toxicity  
among Fish and Mammals.\*  
AD-A229 065
- \*ACOUSTICS  
Effects of Turbulence on  
Stationary and Nonstationary  
Processes in C-Systems.\*  
AD-A227 067  
Mechanisms Mediating the  
Perception of Complex Acoustic  
Patterns.\*  
AD-A229 472
- \*ADAPTIVE CONTROL SYSTEMS  
Dynamic Compensation-Based  
Adaptive Control.\*  
AD-A225 681  
Adaptive Control of Large Space  
Structures.\*  
AD-A227 304
- \*ADSORPTION  
Reprint: Pyridine Adsorption on  
Polycrystalline Platinum Studied by  
the Radioactive-Labeling Method.  
AD-A223 454  
Reprint: Radioactive Labeling  
Study of Sulfate/Bisulfate  
Adsorption on Smooth Gold  
Electrodes.  
AD-A223 649  
Reprint: Adsorption of Pyridine  
on Polycrystalline Gold Electrode
- Studies by Radioactive-Labeling  
Method.  
AD-A223 653
- \*AERODYNAMIC CHARACTERISTICS  
Control of Unsteady Aerodynamic  
Forces.\*  
AD-A227 365
- \*AERODYNAMIC LOADING  
Analysis of Dynamic Transient  
Response and Postflutter Behavior  
of Super-Maneuvering Airplane.\*  
AD-A224 126
- \*AERODYNAMICS  
Air Force Research in Aero  
Propulsion Technology (AFRAPT).  
AD-A229 612
- \*AEROELASTICITY  
Analysis of Dynamic Transient  
Response and Postflutter Behavior  
of Super-Maneuvering Airplane.\*  
AD-A224 126
- \*AERONAUTICAL ENGINEERING  
Adaptive Control of Large Space  
Structures.\*  
AD-A227 304
- \*AEROSPACE SYSTEMS  
Center of Excellence in  
Aerospace Automation.\*  
AD-A224 570
- \*AIR FORCE RESEARCH  
United States Air Force Research  
Initiation Program for 1988. Volume  
1.\*  
AD-A223 123  
United States Air Force Research  
Initiation Program for 1988. Volume  
2.\*  
AD-A223 124  
United States Air Force Research  
Initiation Program for 1988. Volume  
3.\*  
AD-A223 125  
United States Air Force Research  
Initiation Program for 1988. Volume
- 4.\*  
AD-A223 126  
Laboratory Graduate Fellowship  
Program, 1989.\*  
AD-A223 656  
Laboratory Graduate Fellowship  
Program, 1989. Appendix A. Forms.\*  
AD-A223 657  
Air Force Office of Scientific  
Research Technical Report  
Summaries: April-June 1990.\*  
AD-A227 367  
Air Force Office of Scientific  
Research Technical Report  
Summaries: January-March 1990.\*  
AD-A227 368
- \*AIRCRAFT  
Analysis of Dynamic Transient  
Response and Postflutter Behavior  
of Super-Maneuvering Airplane.\*  
AD-A224 126
- \*AIRFOILS  
Control of Unsteady Aerodynamic  
Forces.\*  
AD-A227 365  
Computational Studies of  
Compressibility Effects on Dynamic  
Stall.\*  
AD-A229 007
- \*ALGORITHMS  
The Development and Evaluation  
of Numerical Algorithms for MIMO  
computers.\*  
AD-A223 476  
Optimization Algorithms for New  
Computer Architectures with  
Application to Routing and  
Scheduling (Year 3).\*  
AD-A228 542  
A Complexity Theory of Neural  
Networks.\*  
AD-A229 432
- \*ALLOYS  
Growth and Deformation  
Mechanisms of Refractory Alloy  
Hybrid Materials.\*  
AD-A222 853

UNCLASSIFIED

- \*ALUMINUM ALLOYS  
Processability and High Temperature Behavior of Emerging Aerospace Alloys.\*  
AD-A224 285
- \*ALUMINUM COMPOUNDS  
Reprint: Preparation of Silicon Carbide/Aluminum Nitride Ceramics Using Organometallic Precursors.  
AD-A226 865
- \*AMINES  
Physical Chemistry of Energetic Nitrogen Compounds.\*  
AD-A229 480
- \*AMINO ACIDS  
Uses of Tyrosine in Foods to Amplify Catecholamine Release.\*  
AD-A229 126
- \*AMMONIA  
Reprint: Ammonolysis of Tantalum Alkyls: Formation of Cubic TaN and a Trimeric Nitride, (Cp\*MeTaN)<sub>3</sub>.  
AD-A223 541  
Reprint: A Pyrolysis Mechanism for Ammonia.  
AD-A226 847
- \*AMMONIUM COMPOUNDS  
Reprint: Temperature Dependence of the Collisional Quenching of NH(a 1(Delta)) by N<sub>2</sub>, O<sub>2</sub>, CO, and Xe.  
AD-A223 652
- \*ANALOG SYSTEMS  
Analog Optical Neural Nets: A noise Sensitivity Analysis.\*  
AD-A226 789  
A Complexity Theory of Neural Networks.\*  
AD-A229 432
- \*ANATOMICAL MODELS  
Reprint: A Frequency Domain Technique for Characterizing Nonlinearities in Biological Systems.
- AD-A223 331
- \*ANGULAR MOMENTUM  
Reprint: Electronic Spectroscopy of the AOH and AOD Complexes.  
AD-A226 740
- \*ANIONS  
Reprint: Radioactive Labeling Study of Sulfate/Bisulfate Adsorption on Smooth Gold Electrodes.  
AD-A223 649  
Theoretical Investigations of Negative Ions in a Hydrogen Source.\*  
AD-A229 486
- \*ANTIFERROMAGNETISM  
Laboratory Graduate Fellowship Program, 1989. Appendix E. Thesis.\*  
AD-A223 722
- \*ANTIPROTONS  
Antiproton Studies in Penning Traps.\*  
AD-A224 498
- \*APPLIED MATHEMATICS  
AMS-SIAM Summer Seminar on the Mathematics of Random Media Held in Blacksburg, Virginia on May 29-June 9, 1989.\*  
AD-A226 141  
(DURIP) Exploring and Controlling Spatio Temporal Chaos Under Complex Structures through Visualization: A Mini-Supercomputer Approach.\*  
AD-A226 793
- \*APPROXIMATION(MATHEMATICS)  
Nearby Variables with Nearby Conditional Laws and a Strong Approximation Theorem for Hilbert Space Valued Martingales.\*  
AD-A225 992
- \*ARGON  
Reprint: Fluorescence Decay and Non-Radiative Relaxation Dynamics
- of the A 2 sigma(+) States of OH-Ar and OD-Ar.  
AD-A226 833  
Reprint: A Potential Surface for Ar-OH(2Sigma) and Ar-OD(2Sigma): Fitting and Assigning Experimental Data with Rigorous Theory.  
AD-A226 993
- \*ARTIFICIAL INTELLIGENCE  
Explorations of Anatomy of Connectionist Models for Visual Lexical Access.\*  
AD-A224 845  
Artificial Intelligence Methods in Pursuit Evasion Differential Games.\*  
AD-A227 366  
Representations in Mental Models.\*  
AD-A229 401
- \*ASYNCHRONOUS SYSTEMS  
Reprint: Model-Free Distributed Learning.  
AD-A226 665
- \*ATMOSPHERE ENTRY  
The Near-Earth Orbital Environment Coupling to Its Energy Sources.\*  
AD-A222 435
- \*ATMOSPHERE MODELS  
Atmospheric Structure & Variability.\*  
AD-A223 439
- \*ATMOSPHERIC DISTURBANCES  
Laboratory Graduate Fellowship Program, 1989. Appendix E. Thesis.\*  
AD-A223 722
- \*ATMOSPHERIC PHYSICS  
Reprint: Longitude and Temporal Variations of Energetic Electron Precipitation Near the Trapping Boundary.  
AD-A223 371
- \*ATOMIC PROPERTIES

SUBJECT INDEX-2  
UNCLASSIFIED EVI268

ALU-ATO

# UNCLASSIFIED

Energetic X-ray Processes in Atoms.\*  
AD-A224 997

\*ATOMS  
Diagnostics for Hydrogen Atoms and Molecules in H-Atom Sources and Beams Using VUV Laser Light.\*  
AD-A222 340

Spectroscopic Studies of the Products of the Reactions of Electronically Excited Atoms and Small Molecules.\*  
AD-A224 017

Reprint: Oxygen Quenching of Positronium in Silica Gels.  
AD-A226 917

\*ATTENTION  
Attention, Imagery, and Memory: A Neuromagnetic Investigation.\*  
AD-A224 560

Pre-Attentive and Attentive Visual Information Processing.\*  
AD-A228 541

\*AUDITORY PERCEPTION  
Complex Auditory Signals.\*  
AD-A224 127

Auditory Processing of Complex Sounds.\*  
AD-A224 147

Demodulation Processes in Auditory Perception.\*  
AD-A226 824

Signal Processing and Recognition in Adaptive Neural Networks.\*  
AD-A226 828

\*AUDITORY SIGNALS  
Complex Auditory Signals.\*  
AD-A224 127

Auditory Pattern Memory.\*  
AD-A229 743

\*AURORAE  
Reprint: Particle Acceleration by Intense Auroral VLF Turbulence.  
AD-A228 764

Reprint: Particle Acceleration

by Electromagnetic Ion Cyclotron Turbulence.  
AD-A228 838

\*AXES  
Facility for Research in Environmentally Assisted Fracture and Mechanical Behavior.\*  
AD-A224 637

\*AXISYMMETRIC FLOW  
Coupled Experimental and Theoretical Investigations of Instability, Chaos and Turbulence in an Axisymmetric Jet Flow.\*  
AD-A225 971

\*BACKGROUND RADIATION  
Cosmic Background Radiation Study  
Sunyaev-Zel'dovich Effect and Small Angular Scale Anisotropy.\*  
AD-A224 782

\*BACKWARD WAVE OSCILLATORS  
Computer Simulations of Radiation Generation from Relativistic Electron Beams.\*  
AD-A228 969

\*BEAM FORMING  
New Approaches to Beamforming, Null Steering, and Filtering.\*  
AD-A225 737

\*BENZENE  
Reprint: Structure of a Dimer Ketone Formed via Fe(CO)5-Promoted Coupling of 7-(p-Cyanophenoxy)Norbornadiene to Carbon Monoxide.  
AD-A225 945

Design, Ultrastructure and Dynamics of Nonlinear Optical Interactions in Polymeric Thin Films.\*  
AD-A228 876

\*BIOCHEMISTRY  
Symposium on Metals in Biochemistry and Materials Science.\*

AD-A225 481

\*BIOPHYSICS  
International Biophysics Congress (8th) Held in Bristol, United Kingdom on 29 July-4 August 1984. Final Programme and Book of Abstracts.\*  
AD-A223 988

\*BIPOLAR TRANSISTORS  
Joint Services Electronics Program.\*  
AD-A226 198

\*BLOCK COPOLYMERS  
Synthesis of Energetic Acid Labile LOVA Binders.\*  
AD-A225 987

\*BONDING  
Reprint: Electronic Spectroscopy of the ArOH and ArOD Complexes.  
AD-A226 740

\*BOUNDARY LAYER  
Non-Equilibrium Chemistry Effects on Hypersonic Separated Flows--Shock-Wave/Boundary-Layer Interaction.\*  
AD-A229 015

\*BOUNDARY LAYER TRANSITION  
Navier-Stokes Simulation of Boundary-Layer Transition.\*  
AD-A226 351

\*BOUNDARY VALUE PROBLEMS  
Reprint: Preconditioning and Boundary Conditions.  
AD-A224 798

\*BRAIN  
Multi-User Facility for High Performance Optical Recording of Brain Activity (DURIP).\*

AD-A223 491

Electrical Interactions between Mammalian Cortical Neurons.\*  
AD-A225 008

Bioreactivity: Studies on a

SUBJECT INDEX-3  
UNCLASSIFIED  
EVI26B

ATO-BRA

UNCLASSIFIED

Simple Brain Stem Reflex in  
Behaving Animals.\*  
AD-A226 823

\*8Z AGENTS

Semiconductor Engineering for  
High-Speed Devices.\*  
AD-A224 565

\*CALCULUS OF VARIATIONS

Integration by Parts and the  
Malliavin Calculus.\*  
AD-A223 334

\*CAMERAS

Advanced Flow Visualization and  
Image Processing Instrumentation.\*  
AD-A224 574

\*CARBON FIBERS

Fundamental Studies of Near  
Surface Modification of Carbon  
Fibers.\*  
AD-A225 910

\*CARBON MONOXIDE

Reprint: Carbon Monoxide  
Cleavage by (SiOx)3Ta (SiOx =  
(TiBu3SiO(-))): Physical,  
Theoretical, and Mechanistic  
Investigations.  
AD-A225 018

\*CARBON TETRACHLORIDE

Influence of Route and Pattern  
of Exposure on the Pharmacokinetics  
and Hepatotoxicity of Carbon  
Tetrachloride.\*  
AD-A223 461

Reprint: Effect of Oral Dosing  
Vehicles on the Acute  
Hepatotoxicity of Carbon  
Tetrachloride in Rats.  
AD-A223 473

Reprint: Effect of Dosing  
Vehicles on Pharmacokinetics of  
Orally Administered Carbon  
Tetrachloride in Rats.  
AD-A223 474

\*CARBONATES

Reprint: Preparation and  
Properties of Uniform Mixed and  
Coated Colloidal Particles. Part 5.  
Zirconium Compounds.  
AD-A222 553

\*CARBOXYLIC ACIDS

Reprint: Acidity of Carboxylic  
Acids: Due to Delocalization or  
Induction?  
AD-A226 834

\*CAREERS

United States Air Force High  
School Apprenticeship Program: 1989  
Program Management Report. Volume  
1.\*  
AD-A223 281

United States Air Force High  
School Apprenticeship Program: 1989  
Program Management Report. Volume  
2.\*  
AD-A223 282

United States Air Force High  
School Apprenticeship Program: 1989  
Program Management Report. Volume  
3.\*  
AD-A223 283

\*CELLS(BIOLOGY)

Flow Cytometric Analysis of  
Hepatocytes from Normal, PFDA, and  
PH/DEN/PB-Treated Rats.\*  
AD-A223 785

\*CHEMICAL DISSOCIATION

Reprint: Ammonolysis of Tantalum  
Alkyls: Formation of Cubic TaN and  
a Trimeric Nitride, (Cp\*MeTaN)3.  
AD-A223 541

\*CHEMICAL PROPERTIES

Physical Chemistry of Energetic  
Nitrogen Compounds.\*  
AD-A229 480

\*CHEMICAL REACTIONS

Reprint: AM1 Studies of E2  
Reactions. 1. Mechanism and Leaving  
Group Effects.  
AD-A222 500

\*CERAMIC MATERIALS

Micromechanics of Size Effect in  
Failure Due to Distributed  
Cracking.\*  
AD-A223 211

Surface Chemistry and Structural

Effects in the Stress Corrosion of  
Glass and Ceramic Materials.\*  
AD-A223 305

Workshop on the Chemical  
Processing of Structural Ceramics  
for Use in Severe Environments Held  
in Dayton, Ohio on 16-18 July  
1984.\*  
AD-A224 410

HREM Studies of Interfaces in  
ZrO2/A12O3 Ceramics.\*  
AD-A224 901

HREM of Incoherent ZrO2/A12O3  
Interfaces.\*  
AD-A224 902

Heterocycles Based on Group III,  
IV, and V Elements, Precursors for  
Novel Glasses and Ceramics.\*  
AD-A226 988

Electrophoretic and Electrolytic  
Deposition of Ceramic Particles on  
Porous Substrates.\*  
AD-A227 371

\*CHANNELS

Investigation of a New Concept  
in Semiconductor Microwave  
Oscillators.\*  
AD-A226 785

\*CHEMICAL DISSOCIATION

Reprint: Ammonolysis of Tantalum  
Alkyls: Formation of Cubic TaN and  
a Trimeric Nitride, (Cp\*MeTaN)3.  
AD-A223 541

\*CHEMICAL PROPERTIES

Physical Chemistry of Energetic  
Nitrogen Compounds.\*  
AD-A229 480

\*CHEMICAL REACTIONS

Reprint: AM1 Studies of E2  
Reactions. 1. Mechanism and Leaving  
Group Effects.  
AD-A222 500

Gordon Research Conference on  
Organometallic Chemistry Held in  
Andover, New Hampshire on August 13-  
17, 1984.\*  
AD-A226 673

SUBJECT INDEX-4  
UNCLASSIFIED EV1268

BZ -CHE

# UNCLASSIFIED

Reprint: Accuracy in Ab Initio Reaction-Energy Computations. 1. Compounds of First-Row Elements. AD-A226 794

Reprint: Comments on a Comparison of AM1 with the Recently Developed PM3 Method. AD-A226 850  
Use of D2 to Elucidate OMVPE growth Mechanisms.\* AD-A226 966

\*CHLORDFORM  
Reprint: Synthesis and Reactions of Meso- and dl-D(3)-Trishomocubylidene-D(3)-Trishomocubane. AD-A225 912

\*CHRONOBIOLOGY  
Reprint: International Society for Chronobiology International Conference (19th) Held in Bethesda, Maryland on 20-24 June 1989. Abstracts. AD-A226 990

\*CIRCADIAN RHYTHMS  
Pharmacological Resetting of the Circadian Sleep-Wake Cycle Effects of Triazolam on Reentrainment of Circadian Rhythms in a Diurnal Primate.\* AD-A224 227

\*CIRRUS CLOUDS  
Reprint: The Relevance of the Microphysical and Radiative Properties of Cirrus Clouds to Climate and Climatic Feedback. AD-A228 801

\*CLOSED LOOP SYSTEMS  
Feedback Control in Distributed Parameter Systems.\* AD-A229 433

\*CLOUD PHYSICS  
Reprint: The Relevance of the Microphysical and Radiative Properties of Cirrus Clouds to

Climate and Climatic Feedback. AD-A228 801

\*CLUSTERING  
Potential Energy Surfaces and Stability of High Energy Content Excited Bound Clusters.\* AD-A224 611  
Gordon Research Conference on Organometallic Chemistry Held in Andover, New Hampshire on August 13-17, 1984.\* AD-A226 673

Heteronuclear Metal Cluster Compounds Synthesis and Reactivity.\* AD-A226 815

\*COGNITION  
Reminding-Based Learning.\* AD-A224 421  
Ability and Metacognitive Determinants of Skill Acquisition and Transfer.\* AD-A224 569

The Role of Central Monoaminergic Systems in Arousal and Selective Attention.\* AD-A224 873

Comparative Analytical Study of Evoked and Event Related Potentials as Correlates of Cognitive Processes.\* AD-A226 331

Cognitive and Neural Bases of Skilled Performance.\* AD-A226 668

Investigating Individual Differences in General Comprehension Skill: The Role of Suppression and Enhancement.\* AD-A226 788

Empirical Network Model of Human Higher Cognitive Brain Functions.\* AD-A227 193

Reprint: The Access and Use of Relevant Information: A Specific Case and General Issues. AD-A228 753

\*COLLISIONS

Reprint: Temperature Dependence of the Collisional Quenching of NH(a 1(Delta)) by N2, O2, CO, and Xe. AD-A223 652

\*COLOR VISION  
Eye Movements and Spatial Pattern Vision.\* AD-A225 357

\*COMBUSTION  
Transport in Dump Combustors.\* AD-A224 790  
Asynchronous Optical Sampling for Laser-Based Combustion Diagnostics in High-Pressure Flames.\* AD-A229 045

Vortex Simulation of Turbulent Combustion.\* AD-A229 079

\*COMBUSTION PRODUCTS  
Reprint: Planar Laser-Fluorescence Imaging of Combustion Gases. AD-A227 213

\*COMMUNICATION AND RADIO SYSTEMS  
Some Applications of Probability and Statistics in Communication Theory and Signal Processing.\* AD-A226 889

\*COMMUNICATIONS NETWORKS  
Reprint: Algorithms for Approximating the Performance of Multimode Systems. AD-A224 524

\*COMPOSITE MATERIALS  
Role of Interfaces and Interphases in the Evolution Mechanics of Material Systems.\* AD-A222 702  
The Overall Response of Composite Materials Undergoing Large Elastic Deformations.\* AD-A224 509  
Reprint: The Materials Science

SUBJECT INDEX-7  
UNCLASSIFIED EVI268

CON-DEC

# UNCLASSIFIED

AD-A223 769

## \*DEFECTS(MATERIALS)

In Situ Fault Detection by the Hybrid Ray Mode Method.\*  
AD-A224 735

## \*DEFORMATION

Growth and Deformation Mechanisms of Refractory Alloy Hybrid Materials.\*

AD-A222 853

Integrated Multiaxial and High Precision Computer Controlled Servohydraulic Mechanical Testing System.\*

AD-A223 422

The Overall Response of Composite Materials Undergoing Large Elastic Deformations.\*

AD-A224 509

Fundamental Studies on High Temperature Deformation, Recrystallization, and Grain Growth of Two-Phase Materials.\*

AD-A229 017

## \*DENSE GASES

Investigation and Modeling of Radiation Absorption Processes and Opacities in Dense Plasmas.\*

AD-A228 749

## \*DEOXYRIBONUCLEIC ACIDS

Reprint: Molecular 'Light Switch' for DNA: Ru(bpy)<sub>2</sub>(dppz)<sub>2</sub>+.  
AD-A224 356

## \*DEPOSITION

DoD-URIP Thin Film Deposition Equipment.\*  
AD-A223 421

## \*DERIVATIVES(MATHEMATICS)

Sampling Designs for Estimating Integrals of Stochastic Processes Using Quadratic Mean Derivatives.\*  
AD-A225 961

## \*DESORPTION

Reprint: Direct Observation of

Adsorbate-Adsorbate Repulsions

Along a One-Dimensional Array: CO on the Steps of Pt(112).  
AD-A224 293

## \*DETECTION

In Situ Fault Detection by the Hybrid Ray Mode Method.\*  
AD-A224 735

## \*DETECTORS

Sensor Based Control of Robotic Mechanisms.\*  
AD-A226 784

## \*DETONATION WAVES

The Structure and Stability of Three Dimensional Detonation Waves.\*  
AD-A224 465

## \*DIAGNOSIS(GENERAL)

Development of Laser Spectroscopic Diagnostics to Support Advanced Compound Semiconductor Deposition Techniques.\*  
AD-A226 057

## \*DIAGNOSTIC EQUIPMENT

Research on Certain Aspects of Laser Diffraction Particle Size Analysis Relevant to Autonomous Self-Diagnosing Instrumentation.\*  
AD-A226 822

Asynchronous Optical Sampling for Laser-Based Combustion Diagnostics in High-Pressure Flames.\*  
AD-A229 045

## \*DIFFERENTIAL EQUATIONS

Interacting Hilbert Space Valued Stochastic Differential Equations and Propagation of Chaos.\*  
AD-A225 991

## \*DIFFUSION

Reprint: The Variational Principle for Optimal Control of Diffusions with Partial

Information.

AD-A222 383  
Reprint: High Pressure NMR Study of Transport and Relaxation in Complex Liquids of 2-Ethylhexyl Cyclohexanecarboxylate and 2-Ethylhexyl Benzoate.  
AD-A223 423

## \*DIFFUSION COEFFICIENT

Reprint: High Pressure NMR Study of Transport and Relaxation in Complex Liquids of 2-Ethylhexyl Cyclohexanecarboxylate and 2-Ethylhexyl Benzoate.  
AD-A223 423

## \*DIGITAL COMPUTERS

Final Report for Grant AFOSR-83-0315 (Texas University).\*  
AD-A224 896

## \*DIGITAL RECORDING SYSTEMS

DURIP Application of Multiprocessing to Real-Time Analysis and Control of an Ionospheric Research Radar.\*  
AD-A226 332

## \*DIGITAL SYSTEMS

Reprint: Direct Observation of Adsorbate-Adsorbate Repulsions Along a One-Dimensional Array: CO on the Steps of Pt(112).  
AD-A224 293

## \*DIMERS

Reprint: Silicon Dimer Formation by Three-Body Recombination.  
AD-A223 455

## \*DIPOLES

Reprint: Direct Observation of Adsorbate-Adsorbate Repulsions Along a One-Dimensional Array: CO on the Steps of Pt(112).  
AD-A224 293  
Investigation of a New Concept in Semiconductor Microwave Oscillators.\*  
AD-A226 785

SUBJECT INDEX-8

UNCLASSIFIED EVI268

DEF-DIP

# UNCLASSIFIED

\*DISLOCATIONS  
The Role of Ledges in Phase Transformations.\*  
AD-A228 750

\*DISPERSING  
Particle Dispersion in a Turbulent Shear Flow.\*  
AD-A224 327

\*DOPPLER EFFECT  
DURIP Application of Multiprocessing to Real-Time Analysis and Control of an Ionospheric Research Radar.\*  
AD-A226 332

\*DRAINAGE  
Investigation of a New Concept in Semiconductor Microwave Oscillators.\*  
AD-A226 785

\*DRIFT  
Investigation of a New Concept in Semiconductor Microwave Oscillators.\*  
AD-A226 785

\*DRUGS  
Equipment Support Grant for Air Force Task 'Chemical Defense Drugs Effects with Exercise and Thermal Stress'.\*  
AD-A228 110

\*DYE LASERS  
Development of Laser Spectroscopic Diagnostics to Support Advanced Compound Semiconductor Deposition Techniques.\*  
AD-A226 057

\*DYNAMIC RESPONSE  
The Effect of Nonlinearities on Flexible Structures.\*  
AD-A222 705  
Analysis of Dynamic Transient Response and Postflutter Behavior of Super-Maneuvering Airplane.\*

AD-A224 126

\*DYNAMICS  
Adaptive Time Series Analysis Using Predictive Inference and Entropy.\*  
AD-A222 337

Interface Formation and Percusory Dynamics.\*  
AD-A224 128

Stochastic Dynamics and Bifurcation Behavior of Nonlinear Nonconservative Systems in the Presence of Noise.\*  
AD-A228 923

\*EAR  
Reprint: The Transducer Characteristic of Hair Cells in the Human Ear: A Possible Objective Measure.  
AD-A223 540

\*EDDIES(FLUID MECHANICS)  
An Additive Turbulent Decomposition of the Navier-Stokes Equations Implemented on Highly Parallel Computer Systems.\*  
AD-A223 678  
Numerical Studies of the Structure of Turbulent Shear Flow.\*  
AD-A228 747

\*EIGENVALUES  
Use of an Indefinite Inner Product for Computing Damped Natural Modes.\*  
AD-A223 636

\*ELASTIC PROPERTIES  
The Overall Response of Composite Materials Undergoing Large Elastic Deformations.\*  
AD-A224 509  
Large Space Manipulators Study.\*  
AD-A227 276  
The Stability and Dynamics of Elastic Structures and Fluid Flows.\*  
AD-A229 047  
Estimation of Elastic Parameters

in Linear and Nonlinear Distributed Models of Plates Arising in Large Flexible Space Structures.\*  
AD-A229 527

\*ELASTOMERS  
Reprint: Viscoelasticity and Tearing Energy of Fluorinated Hydrocarbon Elastomers.  
AD-A223 788  
Reprint: The Materials Science and Engineering of Rigid-Rod Polymers.  
AD-A224 806  
Reprint: Reinforcement of Elastomers by the In-situ Generation of Filler Particles.  
AD-A227 208

\*ELECTRIC FIELDS  
Nonlinear Stability in Fluids and Plasma Dynamics-Conformal Quasi-Conformal Geometry: Iteration, Distortion, Dynamics and Circle Packing.\*  
AD-A229 469

\*ELECTRICAL ENGINEERING  
Reprint: Estimability and Regularity of Linear Systems.  
AD-A226 918

\*ELECTRICAL PROPERTIES  
Development of Short Gate Fet's.\*  
AD-A225 588  
Investigation of New Seminsulating Behavior of III-V compounds.\*  
AD-A225 782

\*ELECTROCHEMISTRY  
Electrochemistry of Metal Surfaces.\*  
AD-A224 551

\*ELECTRODES  
Reprint: Radioactive Labeling Study of Sulfate/Bisulfate Adsorption on Smooth Gold Electrodes.

SUBJECT INDEX-9  
UNCLASSIFIED EVI268

DIS-ELE

# UNCLASSIFIED

AD-A223 649

Reprint: Adsorption of Pyridine on Polycrystalline Gold Electrode Studies by Radioactive-Labeling Method.

AD-A223 653

## \*ELECTROENCEPHALOGRAPHY

Reprint: Objective Investigation of Visual Function Using a Nondestructive Zoom-FET Technique for Evoked Potential Analysis.

AD-A223 542

Comparative Analytical Study of Evoked and Event Related Potentials as Correlates of Cognitive Processes.\*

AD-A226 331

Empirical Network Model of Human Higher Cognitive Brain Functions.\*

AD-A227 193

## \*ELECTROMAGNETIC PULSES

Microscopic Models for Electromagnetic Wave Propagation in Highly Dispersive Media.\*

AD-A224 382

## \*ELECTROMAGNETIC WAVE PROPAGATION

Microscopic Models for Electromagnetic Wave Propagation in Highly Dispersive Media.\*

AD-A224 382

## \*ELECTROMAGNETIC WAVE REFLECTIONS

Laboratory Graduate Fellowship Program, 1989. Appendix E. Thesis.\*

AD-A223 722

## \*ELECTRON ACCELERATORS

Investigation of the Propagation of Intense Charged Particle Beams into Vacuum.\*

AD-A225 098

## \*ELECTRON BEAMS

Anomalous Decay of Langmuir Turbulence. High Power, High Frequency Radiation from Beam-Plasma Interactions.\*

AD-A224 282

Reprint: The Electron Beam Instability and Turbulence Theories.

AD-A228 768

Computer Simulations of Radiation Generation from Relativistic Electron Beams.\*

AD-A228 969

## \*ELECTRON CAPTURE

International Conference on the Physics of Electronic and Atomic Collisions (14th) Held in Palo Alto, California on 24-30 July 1985 (Electronic and Atomic Collisions. Invited Papers).\*

AD-A225 738

## \*ELECTRON TRANSITIONS

Reprint: Spectroscopy of the AlAr van der Waals Complex: Rotationally Resolved B 2 Sigma(+) Yields X 2 Pi(1/2) Electronic Transitions.

AD-A226 861

## \*ELECTRONIC EQUIPMENT

Joint Services Electronics Program.\*

AD-A226 198

## \*ELECTRONIC SCANNERS

Development of a High-Imaging Speed SEM for Dynamically Loaded Materials.\*

AD-A229 244

## \*ELECTRONICS

Reprint: Scanning Tunneling Microscopy Investigations of the Local Electronic and Structural Effects of Iron Substitution in Tantalum Disulfide.

AD-A223 650

Joint Services Electronics Program.\*

AD-A226 198

## \*ELECTROOPTICS

Center for Electro Optics & Plasma Research.\*

AD-A224 091

In situ GSBME Growth Monitoring for Optoelectronic Devices.\*

AD-A226 143

Ultrafast Optical Electronics Center.\*

AD-A226 669

Technology Issues in Free-Space Optical Processing.\*

AD-A226 831

Optoelectronic Realizations of Neural Network Models.\*

AD-A228 841

Computational Complexity and Efficiency in Electro-Optical Computing Systems.\*

AD-A229 195

## \*ELECTROPHORESIS

Electrophoretic and Electrolytic Deposition of Ceramic Particles on Porous Substrates.\*

AD-A227 371

## \*ELECTROPHYSIOLOGY

Reprint: Objective Evidence for Phase-Independent Spatial Frequency Analysis in the Human Visual Pathway.

AD-A223 460

Electrical Interactions between Mammalian Cortical Neurons.\*

AD-A225 006

## \*EMOTIONS

Ability and Metacognitive Determinants of Skill Acquisition and Transfer.\*

AD-A224 569

## \*ENERGETIC PROPERTIES

Energetic X-ray Processes in Atoms.\*

AD-A224 997

Reprint: Theory of Multicenter Partitioning of Molecular Energies.

AD-A226 835

Physical Chemistry of Energetic Nitrogen Compounds.\*

AD-A229 480

Joint Services Electronics  
Program. \*  
AD-A226 198

\*FILLERS  
Reprint: Reinforcement of  
Elastomers by the In-situ  
Generation of Filler Particles.  
AD-A227 208

\*FILMS  
Studies of Hetero-Epitaxy of  
GaAs Films on Si Substrate for  
Effective Control of Defect Density  
and Internal Stress. \*  
AD-A226 144  
Properties of II-VI  
semiconductors: Bulk Crystals,  
Epitaxial Films, Quantum Well  
Structures, and Dilute Magnetic  
Systems. Materials Research Society  
Symposium Proceedings. Volume 161. \*  
AD-A229 589

\*FILTERS  
New Approaches to Beamforming,  
Null Steering, and Filtering. \*  
AD-A225 737

\*FINITE ELEMENT ANALYSIS  
A Mixed Finite Element  
Formulation for the Boundary  
Controllability of the Wave  
Equation. \*

AD-A226 086  
Nonlinear Finite Element  
Dynamics on Multiprocessor  
Computers. \*  
AD-A227 408

\*FLAME PROPAGATION  
Reprint: Flame-Turbulence  
Interactions in a Freely-  
Propagating, Premixed Flame.  
AD-A224 500

\*FLAMES  
Reprint: Straining and Scalar  
Dissipation on Material Surfaces in  
Turbulence: Implications for  
Flamelets.  
AD-A223 365  
Chemical Kinetic and Aerodynamic  
Structures of Flames. \*  
AD-A224 281  
Reprint: A Fractal Model of  
Turbulent Flame Kernel Growth.  
AD-A224 499  
Reprint: Flame-Turbulence  
Interactions in a Freely-  
Propagating, Premixed Flame.  
AD-A224 500  
Reprint: Planar Laser-  
Fluorescence Imaging of Combustion  
Gases.  
AD-A227 213

\*FLEXIBLE STRUCTURES  
The Effect of Nonlinearities on  
Flexible Structures. \*  
AD-A222 705  
Research into Traveling Wave  
Control in Flexible Structures. \*  
AD-A224 504  
Control of Complex Multibody  
Spacecraft. \*  
AD-A224 707  
Analytical and Experimental  
Research on Large Angle Maneuvers  
of Flexible Structures. \*  
AD-A226 679  
Novel Dynamics and Controls  
Analysis Methods for Nonlinear  
Structural Systems. \*

UNCLASSIFIED REPORT

ABSTRACT: (U) An effective computational strategy is developed for generating the response of complex systems using (small or large) perturbations from the response of a simple structure (or a simpler mathematical/discrete model of the original structure). Two general approaches are developed for selecting the simpler model and establishing the relations between the original and simpler models. The two approaches are: decomposition or partitioning strategy, and hierarchical modeling strategy. Two effective partitioning strategies are used. The first is based on uncoupling of load-carrying mechanisms, and the second is based on symmetry transformations. The hierarchical modeling used is the predictor-corrector iterative process based on using a simple mathematical model in the predictor phase and correcting the response using a more accurate mathematical model.

ABSTRACT: (U) The research supported by this grant has continued the development of efficient methods for solving optimization problems involving implicitly defined functions that are not everywhere differentiable. Progress has been made on extending a rapidly convergent algorithm for the single variable case to the n variable case. A specialization of this research has produced a new two matrix quasi-Newton method for smooth minimization. Also, a new fast method has been developed for the single variable case where only function, and not subderivative, values are available.

UNCLASSIFIED REPORT

ABSTRACT: (U) The present report summarizes two projects. The first project, which focuses on riskless choice, involves a series of experiments that demonstrate the phenomenon of loss aversion: losses and disadvantages have greater impact on preference than gains and advantages. The evidence shows that choice depends on the status quo or reference level, and that changes of reference point often lead to reversals of preference. To account for these observations, we develop a reference-dependent theory of individual choice, which explains such effects by a deformation of the preference map about the reference point. Implications of loss aversion to both individual and aggregate behavior are explored. The second project, which focuses on decision under uncertainty, extends prospect theory by incorporating a cumulative (i.e., rank-dependent) weighting scheme. In this model, the carriers of value are gains and losses, defined relative to a reference point, and the impact of uncertainty is summarized by different weighting functions for gains or for losses. Two evaluation principles -- diminishing sensitivity and loss aversion -- are invoked to explain the characteristic curvature of the value function and the weighting functions. A review of the experimental evidence and the results of a new experiment reveal a distinctive four-fold pattern of risk attitudes: risk aversion for gains and risk seeking for losses of high probability; risk seeking for gains and

risk aversion for losses of low probability.

UNCLASSIFIED REPORT

ABSTRACT: (U) Teleos Research, under the sponsorship of the Air Force Office of Scientific Research, has carried out a two-year program of research on The Synthesis of Intelligent Real-Time Systems. The purpose of the effort was to develop and extend theories and techniques that facilitate the design and implementation of intelligent real-time systems. In particular, Teleos has extended situated-automata theory to apply to situations in which the system has probabilistic information about the world; designed and built a high-level, declarative programming tool for synthesizing efficient programs that track dynamic conditions in the world; clarified the theoretical relationships between Gapps, an existing declarative programming tool for describing action strategies, and the newly designed tool; investigated the possibility of moving the burden of developing correct programs from the human programmer to the agent itself through the use of algorithms that allow the agent to learn from trial and error; applied the principles of situated automata theory to the understanding of existing vision algorithms and the development of new ones; and tested these theoretical principles and design tools in a real robotic domain.

UNCLASSIFIED REPORT

ABSTRACT: (U) A numerical model to solve transition process observed in hypersonic flows over cones has been developed. Low Reynolds number two-equation turbulence models were employed with a production term modification (PTM) technique. The approach determined the extent of the transition zone. The onset of transition was imposed using experimental measurements when available. When not available, the onset of transition was determined by a stability criterion which is related to the Bushnell-Reshotko transition criterion. The PTM technique was incorporated into a NASA-Ames implicit Reynolds averaged Navier Stokes solver, the TURF code, and tested for transitional hypersonic flows over flat plates. The model parameters were tuned as a function of free stream Mach number. The PTM technique was also tested for transitional hypersonic flows over sharp cones and blunt cones for a variety of flow conditions. Comparisons of computed heat transfer with experimental measurements are shown to be good.

UNCLASSIFIED REPORT

ABSTRACT: (U) Studies were conducted on the induction,  
expression, and stabilization of long-term potentiation  
(LTP), a form of synaptic plasticity that is likely to  
participate in memory encoding. Induction was shown to  
involve a glycine receptor site that modulates calcium  
fluxes through a subclass of transmitter receptors. Other  
results indicated that LTP expression is not likely to  
involve release or changes in spine increased resistance,  
but did provide direct evidence that potentiation  
reflects a change in the conductance properties of post-  
synaptic receptors. The hypothesis was developed that  
stabilization of LTP involves a disconnection and  
reconnection of adhesive relationships that maintain the  
organization of the synaptic region. This involves a  
calcium sensitive protease that cleaves cytoskeletal  
proteins and the exposure of a group of adhesion  
receptors known as integrins. Together with results from  
previous years of support, and from other laboratories,  
work over the past year has led to a reasonable complete  
hypothesis concerning how synapses can be rapidly  
transformed from one stable state to another and thus be  
used as memory storage devices.

ABSTRACT: (U) With the assistance of this grant, my laboratory has progressed substantially and is now beginning to produce results. This last year, in addition to lab build-up and student supervision, I have continued work on the amorphous rare earth transition metal alloys. There are several significant new results arising from this work. A model for the growth-induced macroscopic magnetic anisotropy: I have clear evidence against Takeshi Egami's Bond-Oriental Anisotropy model which attributes the anisotropy to anelastic strain. He describes this model as a simple increase in the number of bonds in-plane compared to out-of-plane due to stress during the growth. I find a strong (more than an order of magnitude) dependence of the anisotropy on deposition temperature and essentially no dependence on the state of stress either during the growth or after. I believe the reason for the anisotropy is a texturing of the short-range order relative to the surface, which minimizes surface energy at every instant during the growth, and gets frozen into the structure. (JS)

ABSTRACT: (U) Chemical modification of GaAs surfaces with and without photoenhancement can produce large variations in the Schottky barriers for metals which are subsequently deposited. Deep ultraviolet light enhanced oxidation of the GaAs surfaces produces barrier variation toward the ideal Schottky limit, however, there is no evidence that the number of interface states is reduced. A calculation suggests that this can be explained by the interface state energy distribution being altered to shift the states toward the band gap edges, possible by a photochemical reaction of oxygen. This allows a wider range of Fermi level movement. Different procedures to introduce oxygen at the metal/GaAs interface without photoenhancement result in different barrier variations. Therefore, altered interface chemistry, as well as the mere presence of a species at the interface, is shown to be important for Schottky barrier formation.

UNCLASSIFIED REPORT

ABSTRACT: (U) In some instances group comparisons in  
terms of upper or lower portions of the score  
distributions are more informative than comparisons of  
central tendency. These comparisons can be done by  
carrying out a split on the data prior to an analysis of  
variance (ANOVA). The resulting test statistic from ANOVA  
is not distributed as an F ratio however, and requires  
evaluation for significance relative to an empirical  
monte-carlo distribution. An example and computer program  
are presented.

DESCRIPTORS: (U) COMPUTER PROGRAMS, DISTRIBUTION,  
MONTE CARLO METHOD, SPLITTING.

IDENTIFIERS: (U) Percentile contrasts, Statistical  
inference.

ABSTRACT: (U) Experiments were conducted further  
investigating the role of both spatial frequency channels  
and grouping mechanisms in texture segregation. Patterns  
were constructed in which differences in the outputs of  
Gabor filters fail to account for the perceived  
segregation. Perceived segregation is, however, predicted  
by the outputs of DOG filters. The results suggest that  
there are at least two primitives for texture segregation:  
Changes in the orientations of a stimulus in which the  
slopes of the component features do not change, e.g., a  
180 degree rotation of a stimulus, yields stronger  
segregation with a 3D figure than with a 2D figure. We  
hypothesize that the segregation differences are due to  
grouping processes. A 3D representation makes explicit  
the orientations of object surfaces enabling grouping of  
3D figures by the similarity of their surface  
orientations, e.g., the directions of their surface  
normals.

ABSTRACT: (U) The research explored various aspects of visual processing in the perception of features and objects. Studies of visual features tested the level of abstraction of the coding of orientation, the emergence of features in surface media defined by texture, motion or depth, and the role of similarity in preattentive representation of coarsely coded values. Object perception was explored in a series of studies requiring subjects to conjoin features, and testing the role played by spatially selective attention. The results suggested a modification of feature integration theory, allowing some preattentive control through feature maps. We also found evidence for object-specific tokens in the coding of dynamic displays of moving, changing objects. In studies of perceptual learning, extended practice effects were shown to be very specific to details of the practice situation. Finally, visual memory for arbitrary line patterns showed both surprising plasticity (long-lasting traces after a single presentation of 50 patterns) and surprising dissociations between implicit and explicit tests. ABSTRACT: (U) The goal of our research is to develop practical models and efficient algorithms to analyze the reliability/availability/maintainability of complex systems in which component failures are statistically dependent and each component is subject to degradations before complete failure. The Cause-Based Multimode Model (CBMM) was developed. Practical and computationally tractable solution methods were designed. In addition, an ordered enumeration approach was developed to solve the network survivability enhancement problem. Preliminary computational experiments showed that this approach is very efficient.

DESCRIPTORS: (U) , RELIABILITY.

IDENTIFIERS: (U) Reliability analysis, Dependent failures, Multimode failures, Ordered enumeration.

ABSTRACT: (U) In this paper we study the hole pressure problem for plane, steady, creeping shear flows of a Johnson-Segalman model. To correctly apply the theory of Higashitani, Pritchard, Baird & Lodge (HPBL), we start with a modified hole pressure relation (MHPR) and we simulate the hole pressure measurement by FEM and multi-mesh extrapolation techniques. The path integrals of MHPR & HPBL are evaluated and a full instrument simulation is conducted. An encouraging agreement between the simulated hole pressure and the analytical prediction is found, within the computationally-accessible range of  $De < 1$ , which supports the postulates about the possible error cancellation in MHPR and the validity of HPBL for J-S fluid. This numerical investigation experiment and other numerical work, that N sub 1 can be predicted via the HPBL equations to a sufficient approximation to be of practical use. Keywords: Non-Newtonian flows, Couette flow, Poiseuille flow, Hole pressure, Johnson-Segalman fluid, HPBL equations, Error cancellation, Numerical simulation, Finite element method, Posterior error analysis, Multi-mesh extrapolation.

UNCLASSIFIED REPORT

ABSTRACT: (U) Neodymium-doped silica glass is the most  
desirable glass for Q-switched and amplifier applications  
due to broad transmission range, a low nonlinear  
refractive index, low CTE, high lasing efficiency at room  
temperature, possibility of large size media and possible  
use of sensitizers to increase energy efficiency. However,  
preparation of such a glass by conventional melting  
requires very high temperature resulting in deleterious  
contamination from the melting crucible. Addition of  
fluxes to lower the melting temperature however degrades  
the physical and the optical properties of the glass. Sol-  
gel technology is a novel way of fabricating glass  
without melting. This process uses silicon alkoxides for  
making a sol which is cast into a gel. Heat treatment of  
this gel at high temperature (still much lower than  
melting) results in glass. This study explored the  
fabrication of Nd-doped silica glass by two different sol-  
gel techniques, namely, mixing and impregnation. The  
latter process, which requires impregnation of an Nd-  
containing solution into an ultraporous dehydroxylated  
silica matrix, was successfully developed. A buffer  
element, Al, was used to prevent cluster quenching of the  
fluorescence lifetime of the laser glass. Crack-free  
monolithic disks of 3.0 weight % Nd2O3 in silica glass

UNCLASSIFIED REPORT

ABSTRACT: (U) This project was concerned with problems in operator theory and matrix theory that underlie the maximum entropy principle in signal processing and systems theory. Two papers have been completed that generalize this principle to a wide class of indefinite hermitian matrices. Three new papers give a thorough study of rank-preserving extensions of band matrices. Factorization theorems are obtained for wide classes of Toeplitz and Hankel matrices, and connections are given to the Kalman partial realization problems in signal processing. Applications are also given to signal processing when the power spectrum consists of a set of pure line spectra. In another paper, new work on orthogonal polynomials and the Gohberg-Semencul formula for the inverse of a Toeplitz matrix has been completed. Three new papers generalize for rational matrix functions a number of well-known interpolation problems for scalar functions. A new approach to tangential interpolation problems is presented, and applications are given to sensitivity minimization in control theory.

ABSTRACT: (U) This report describes a three-year program of research on category learning in unsupervised environments, and the role of learned categories in the processing and retention of individual instances. A computational model of unsupervised category learning is described, and the model's implications for the evaluation, comparison, and memorization of instances are explored in several experiments. We introduce a new index of unsupervised learning, referred to as attribute listing, and show that such learning tends to optimize the encoding of instance features and their organization in memory. The empirical techniques developed in this project appear to hold considerable promise for further research on conceptual knowledge and its role in cognitive performance.

ABSTRACT: (U) The major concern of this year's research was modeling the neural systems of the barn owl that determine the elevation of sound sources. Models of the nucleus ventralis lemnisci lateralis pars posterior (VLVp) and the lateral shell of the central nucleus of the inferior colliculus (ICL) were developed. Computer simulations demonstrated that these models could account for the most salient experimental phenomena. Future work will test predictions of the models, and hopefully lead to a closed-loop interaction between theory and experiment.

ABSTRACT: (U) The Stanford Center for Research on Superconductivity and Superconductive Electronics is currently focused on developing techniques for producing increasingly improved films and multilayers of the high-temperature superconductors, studying their physical properties and using these films and multilayers in device physics studies. In general the thin film synthesis work leads the way. Once a given film or multilayer structure can be made reasonably routinely, the emphasis shifts to studying the physical properties and device physics of these structures and on to the next level of film quality or multilayer complexity. Our most advanced thin films synthesis work in the past year has involved developing techniques to deposit a-axis and c-axis YBCO/PBCO superlattices and related structures. The in situ feature is desirable because no solid state reactions with accompanying changes in volume, morphology, etc., that degrade the quality of the film involved. (RRH)

UNCLASSIFIED REPORT

ABSTRACT: (U) This annual report documents the results of a basic research program aimed at (1) studying the high temperature failure mechanisms in ceramics, (2) establishing relationships between cavitation mechanisms and creep crack growth characteristics, and (3) developing a damage mechanism-based life prediction model. During the reporting period, the growth rate, near-tip creep responses, and damage processes of creep cracks in a pyroceram glass-ceramic were studied under tensile loading at elevated temperatures. The results of these studies indicated that creep crack growth in the pyroceram glass-ceramic occurred both in continuous and discontinuous manners, with the damage processes manifested as the nucleation, growth, and coalescence of inhomogeneously distributed cavities and microcracks. Sintering of cavities led to the existence of a growth threshold below which the creep crack would open, blunt, but not propagate. Measurements of the total accumulated creep strain near the crack-tip revealed that creep crack extension followed a critical strain criterion. Relationships between cavitation mechanisms and creep crack growth characteristics of the glass-ceramic are discussed.

UNCLASSIFIED REPORT

ABSTRACT: (U) NMR imaging has been applied to some elastomeric materials of industrial and military interest. The T2 spin-spin relaxation times of common elastomers, particularly after filling and curling, are sufficiently short that spin-echo sequences at submillisecond echo times cannot produce T2-independent images. The sensitivity to T2 potentially makes spin echo imaging a good probe of elastomer blend composition, as demonstrated for a series of filled and cured cis-polybutadiene, styrene-butadiene rubber blends. The technique can be used to distinguish good and bad carbon black dispersion in actual tire tread samples. The configuration of polyester tire cord, voids, rubber layer boundaries, apparent migration of additives, and other inhomogeneities can be detected in end-product tire samples. NMR images have been obtained for four porous glass disks of different porosities as models of materials such as oil cores. The mottled appearance often seen for such images is attributed largely to insufficient signal-to-noise ratio, and not pore structures. Comparison of spin-echo and gradient-echo images demonstrates the defect-magnification effect of the gradient-echo.

ABSTRACT: (U) The 1988 First Annual Meeting of the International Neural Network Society (INNS) brings together over 2,000 academic commercializers, and financiers in an open forum for the advancement of the full spectrum of significant neural network research and development, from biology through technology. Formed in 1987 in response to the extraordinary international interest in neural network research, INNS includes among its founders many of the most distinguished leaders of the field. By Spring, 1988, INNS membership had grown to over 2,000 of the field's most active researchers, from 34 countries and 47 states in the United States. These are the people who will determine the future of this strategic technology. The INNS invites all those interested in the exciting, and rapidly expanding field of neural networks to attend its 1988 Annual Meeting. The meeting included plenary lectures, symposia, contributed oral and poster presentations, tutorials, commercial and publishing exhibits, government agency presentations, and social events. Papers pertain to: Pattern Recognition; Network Analysis; Cognition and Learning; Neurobiology; Speech; Sensory-motor Control and Robotics; Implementations; Optics and VLSI; Applications; Vision; Neurocomputers.

UNCLASSIFIED REPORT

ABSTRACT: (U) Research in the reporting period was concentrated on the continuation of a pioneering study of the defects present in thin film GaAs grown by MBE at temperatures between 190 and 300 degree. These layers have attracted recently great interest as buffer layers for the suppression of sidgating between MESFET devices and as active layers for ultrafast photodetectors working in the sub-picosecond range. A comprehensive analysis by magnetic resonance, infrared absorption, Hall effect, x-ray diffraction and particle-induced X-ray emission showed that the transport in these very As-rich layers is dominated by a hitherto unknown kind of hopping conduction between localized arsenic antisite defects present in concentrations up to  $10(20)\text{cm}^{-3}$  and partly compensated by up to  $10(18)\text{cm}^{-3}$  acceptors. The total concentration of excess As reached values pf  $6 \times 10(20)\text{cm}^{-3}$ , corresponding to  $\text{AsGa} = 1.03$ . This was found together with a lattice expansion of up to 0.15 percent. Thermal annealing to temperatures higher than 500 degree C resulted in disappearance of the lattice expansion, a reduction of the antisite defect concentration by at least two orders of magnitude, and the disappearance of hopping conduction. Optically detected magnetic resonance (ODMR) experiments using luminescence emission were successfully implemented, but the luminescence of low-temperature grown GaAs turned out to be too small for detection by ODMF.

ABSTRACT: (U) Despite hypothyroxinemia, PFDA-treated rats are not functionally hypothyroid. Furthermore, any alteration in functional thyroid status can be dissociated from the overt toxicity (i.e., severe hypophagia and body weight loss). PFDA exerts effects on neutral lipid metabolism in both liver and carcass of the rat. At 7 days following a single administration of PFDA, hepatic esterification of free fatty acid into TG and CE was increased yet the expected augmentation in the export of these neutral lipids from liver into plasma was absent. An efficient chemical method was developed for the purification of commercially available PFDA that contains contaminants of mono- and diprotio-substituted materials. PFDA of high specific activity has been synthesized with 14 C-labeling in the C-1 position. In vivo experiments indicate that perfluorinated acid derived radioactivity found in rat tissues behaves similarly to PFDA or PFDA added directly to frozen rat tissue. Hepatic oxidation of long-chain medium-chain and short-chain fatty acids was unaffected by pretreatment with PFDA or PFDA. Similarly, esterification was not affected.

UNCLASSIFIED REPORT

ABSTRACT: (U) As optical instruments and devices see a broader and wider use it becomes necessary to increase their efficiency in order to make them more compact and lighter in weight, particularly for space applications. Nonlinear optical devices, such as second harmonic generators and parametric oscillators, will be an important part of this in order to create new wavelengths and tunable sources. If these devices can be made in fiber form, a significant improvement in efficiency will result. It will then be possible to use the efficient semiconductor lasers as a pump in spite of their poor beam quality. We have investigated the growth of Mg:LiNbO3 in fiber form using the laser-heated pedestal-growth technique. We were able to grow fibers of good optical quality without resorting to post-growth processing. However, we did anneal the fibers to improve their mechanical properties. Different techniques were tried to pole the fibers with limited success.

ABSTRACT: (U) The Center for the Study of Rhythmic Processes began operation in the academic year 1986-1989 and was supported as a Center of Excellence through June 1990. The Center gathered together mathematicians and biologists to work on problems involving neural control of rhythmic motor behavior. There were two main problems addressed during this time. One was the structure and function of the intersegmental coordinating system of the vertebrate spinal cord, using the lamprey as the prototypic example. A broadly applicable mathematical framework was developed and applied. The major research centers of the country working on this preparation were consolidated under the auspices of the Center. The new collaborations led to the design and performance of new experiments based on the mathematics. The second problem was the structure and function of small neural networks, such as the crustacean stomatogastric ganglion. Work was performed on tasks ranging from the biophysics of individual cells to emergent properties of the network.

ABSTRACT: (U) The mechanical and physical properties of Niobium Aluminide intermetallics for high temperature aerospace applications have been measured. NbAl sub 3 was induction melted. Metallographic and chemical analysis has been performed to confirm the composition and microstructure. The coefficient of thermal expansion was determined. Mechanical testing included elevated temperature elastic modulus and microhardness. Continuing work will focus on applying high temperature microhardness with varying load time to creep properties. Also, ingots of the two other intermetallic phases will be received shortly, with similar characterization to follow. Near-net shape processing may be used to form test specimens. A transmission electron microscopy effort will be used to identify deformation mechanisms.

Information Theory, v36 n4 p838-847 Jul 90.

ABSTRACT: (U) The reversion in time of stochastic  
difference equation in hybrid space with a Markovian  
solution is presented in this reprint. The reversion is  
obtained by a Martingale approach, which previously led  
to reverse time forms for stochastic equations with Gauss-  
Markov of diffusion solutions. The reverse time equations  
follow from a particular noncanonical Martingale  
decomposition, while the reverse time equations for Gauss-  
Markov and diffusion solutions followed from the  
canonical Martingale decomposition. The need for this  
noncanonical decomposition stems from the hybrid state  
space situation. Moreover, the non-Gaussian discrete time  
situation leads to reverse time equations that  
incorporate a Bayesian estimation step. The latter step  
is carried out for linear systems with Markovian  
switching coefficients, and the result is shown to  
provide the solution to the problem of fixed-interval  
smoothing. For an application of this smoothing approach  
to a trajectory with sudden maneuvers, simulation results  
are given to illustrate the practical use of the reverse  
time equations obtained.

SUPPLEMENTARY NOTE: Pub. in Cognitive Psychology, v22  
p460-492 1990.

ABSTRACT: (U) Four experiments examine a reminding-based  
generalization view of category learning. According to  
this proposal, when subjects categorize a new instance by  
use of an earlier instance, they learn about the aspects  
common to the two instances and this knowledge may be  
used in later categorizations. Experiment 1 demonstrates  
that which earlier instance is used to categorize a new  
instance affects performance on a later category test.  
Two assumptions of this view are then tested. Experiment  
2 provides evidence for the necessity of distinct  
instance representations to obtain this effect.  
Experiment 3 shows that the reminding effect is due to  
the presence of the common aspects and not imply to the  
increased availability of the instance of which one is  
reminded. The final experiment extends the reminding-  
based learning idea to a situation in which feature  
relevance is provided. This study shows that the  
reminding determines whether this relevance has an effect  
later on categorization time for individual features.  
Discussion focuses on the implications of these results  
for theories of category learning. (EMA)

ABSTRACT: (U) Intense red emission peaking at 703 nm was observed when a heated metal wire was placed downstream of an O<sub>2</sub> generator used in the chemical oxygen iodine laser (COIL) system. The O<sub>2</sub> is produced by bubbling Cl<sub>2</sub> through an alkaline solution of H<sub>2</sub>O<sub>2</sub>. Evidence has been found that this strong red emission requires the presence of both O<sub>2</sub> and Cl<sub>2</sub> in contact with a heated metal surface. Several metals have been used. The red emission spectrum is independent of the metal and the intensity is strongest for copper. An attempt was made to observe laser action but no gain was detected. The identity of the species responsible for the strong red emission has not been established.

UNCLASSIFIED REPORT

ABSTRACT: (U) Theoretical and experimental research has been conducted to elucidate the basic physics behind the properties of superconductor-insulator-superconductor (SIS) tunnel junction receiving devices. The properties of an SIS mixer using a slightly nonideal junction, with finite LO power, were determined by analytic expansion of the equations of the quantum theory of mixing. The resulting equations have a particularly simple form. The minimum noise temperature is controlled by the leakage current of the junction. Even the most nearly ideal junctions made today require a considerable LO for best sensitivity; nevertheless, even a comparatively large leakage current allows mixer noise to be only a small factor above the quantum limit. The saturation properties of SIS mixers subjected to broad-band thermal noise obey the equations derived for monochromatic saturating signals. The Josephson junction tuning inductor was analyzed with the conclusion that such a device is not feasible with present fabrication techniques. Computer calculations using synthetic SIS junction I-V characteristics predicted the performance of an optimized receiver over its entire operating frequency range. Many

AD-A230 167

32

EV126B

aspects of the operation of SIS mixers were clarified and unexpected new phenomena were predicted. A 'photon picture' interpretation of the quantum theory of mixing is in the early stages of development. Niobium nitride edge junctions with excellent current-voltage characteristics were fabricated using novel barrier formation processes. The role of surface damage in the quality of NbN edge junction electrical characteristics was investigated and unexpected results were obtained.

ABSTRACT: (U) The Center for the Study of Rhythmic Processes continued its work on Central Pattern Generators (CPGs), notably on the vertebrate spinal CPG for undulatory locomotion, and the invertebrate crustacean stomatogastric ganglion (STG). For the lamprey, a primitive vertebrate, experiments were designed and performed involving transduction of mechanical motion to neural activity; these experiments were combined with mathematical theory to help understand the relation of structure to function in that network. Other topics investigated included the effects of long coupling fibers, the relationship between muscle activation and movement, and the ability of the network to regenerate. Work on the STG included results on neuromodulators that change the output of the network and mathematical modeling of individual cells as well emergent properties of the network.

## UNCLASSIFIED REPORT

## UNCLASSIFIED REPORT

ABSTRACT: (U) This report describe an experimental two-layer optical neural network built at Caltech. The system uses photorefractive volume holograms to implement dense, modifiable synaptic interconnections and liquid crystal light valves (LCVS) to perform nonlinear thresholding operations. Kanerva's Sparse, Distributed Memory was implemented using this network and its ability to recognize handwritten character-alphabet (A-Z) has been demonstrated experimentally. According to Kanerva's model, the first layer has fixed, random weights of interconnections and the second layer is trained by sum-of-outer-products rule. After training, the recognition rates of the network on the training set (104 patterns) and test set (520 patterns) are 100% and 50%, respectively.

DESCRIPTORS: (U) , DISTRIBUTION, LAYERS, LIGHT, LIQUID CRYSTALS, MEMORY DEVICES, RATES, RECOGNITION, TEST SETS, TRAINING, VALVES, WEIGHT.

IDENTIFIERS: (U) PE61102F, WUAFOSR2305B4.

ABSTRACT: (U) Focused on unsupervised learning and adaptive fuzzy systems. Explored the differential competitive learning (D'L) law. We successfully benchmarked DCL against supervised competitive learning for phoneme recognition and centroid estimation. Proved structural stability for general competitive learning laws. Developed product-space clustering to develop adaptive fuzzy systems, which grow structured fuzzy rules from training data without supervision. Successfully benchmarked adaptive fuzzy systems against neural-network truck-and-trailer systems and Kalman-filter control systems for realtime target tracking.

UNCLASSIFIED REPORT

ABSTRACT: (U) The development of fine-scale multicomponent M2C carbides in AF1410 steel was observed as a function of time at the standard tempering temperature of 510C. Strong departures from equilibrium compositions are observed at early stages of precipitation, and carbide composition appears to be particle size dependent in a given microstructure. Analysis of the carbide composition trajectory during precipitation in terms of the thermodynamic contributions of coherency and capillarity indicates initial nucleation at compositions of reduced interfacial energy but reduced chemical driving force. The ability of multicomponent carbides to follow a precipitation composition trajectory of increasing interfacial energy and increasing driving force appears important to the maintenance of a fine particle size and high number density at late stages of precipitation for overaging resistance. Preliminary evidence is also found for predicted nonuniformity of the matrix composition in the stress field of a coherent particle.

DESCRIPTORS: (U) , CAPILLARITY, CHEMICALS, COHERENCE, COMPOSITION(PROPERTY), ENERGY, FORCE(MECHANICS), HIGH DENSITY, INTERFACES, MATRIX MATERIALS, MICROSTRUCTURE, NUCLEATION, PARTICLE SIZE, PARTICLES, PRECIPITATION,

UNCLASSIFIED REPORT

ABSTRACT: (U) Progress is described in a three-year program of research supported by AFOSR under the High-Energy-Density-Matter (HEDM) initiative. A laser-crossed molecular beam apparatus was constructed which is equipped to probe unique high-energy excited states by: (1) directly detecting anion photoproducts of charge-transfer intermediate excited states; (2) determining internal state distributions following photoionization of high-energy intermediates by time-of-flight photoelectron spectroscopy; and (3) characterizing ion-fragment distributions by time-of-flight mass spectroscopy. This instrument was employed in combination with a second, quadrupole molecular beam system to complete a set of experiments exploring structural and dynamical properties of high-energy matter. AFOSR supported experiments have detected anions arising from energetic charge-transfer configurations of monomeric HCl. Additional work on the same molecule, has probed intermediate-state effects on ion-fragment branching ratios, and, by double-resonance, characterized the dynamics of rotationally state selected spin-orbit autoionization.

DESCRIPTORS: (U) , ANIONS, CHARGE TRANSFER, CONFIGURATIONS, DYNAMICS, FLIGHT, HIGH ENERGY, HYDRIDES, INTERNAL, IONIZATION, MASS SPECTROSCOPY, PHOTOELECTRON SPECTRA, PHOTOIONIZATION, PRODUCTION, STRUCTURAL

ABSTRACT: (U) Irradiation of the isolated bovine retinal pigment epithelium with 430 nm light at 20 mW/cm<sup>2</sup> inhibited the unidirectional flux of leucine, glutamate and chloride in the retina to choroid direction; however, this intensity also produced discernible damage to the mitochondria. Reducing the level of radiation did not affect any of the transport systems studied. Ascorbate, morin or vitamin E did not ameliorate the effect of blue light on transport, whereas melatonin did provide protection by forming an effective light filter. The combination of ethanol and exposure to blue light may constitute a health hazard for humans. Retina-derived factor(s) applied to the apical side of the preparation resulted in a stabilization of the TEP and SCC, followed by a secondary rise in both electrical parameters. These results lead to the hypotheses that the neural retina secretes a factor(s) which is essential for the regulation and maintenance of the RPE under normal physiological conditions and may facilitate repair processes in pathological states.

ABSTRACT: (U) This project is a continuation of the project (AFOSR 84-0389) under the same title 'Research on Materials and Components for Opto-Electronic Signal Processing and Computing.' for the period Oct. 1st, 1984 to Nov. 30th, 1988. Recognizing both the importance of spatial light modulators (SLM) to opto-electronic computing and signal processing and the unique material properties of multiple quantum well (MQW) structures, we have focused our investigation on the electro-optical properties and the growth of InxGa1-xAs/GaAs strained layer material by the molecular beam epitaxy (MBE) method for the SLM's.

ABSTRACT: (U) The Final Report, incorporating Year 3 of the University Research Initiative grant at Carnegie Mellon University on High-temperature Metal Matrix Structural Composites contains sections on processing, characterization, and mechanical properties. These are further divided into reports from individual tasks on powder blending and consolidation, composite performance, structure and composition of composite interfaces, fatigue crack growth, creep, and fracture behavior. Detailed findings, together with listings of technical presentations and publications, are presented in the individual reports from the six tasks conducted under this Grant.

ABSTRACT: (U) The effect of reduced growth area on the lattice mismatch accommodation of InGa1-xAs/GaAs and GaAs/Si grown by molecular beam epitaxy (MBE) has been studied with cross-sectional transmission electron microscopy (XTEM) and cathodoluminescence (CL). Results indicate that the use of step-composition grading and linear-composition grading are particularly effective when combined with reduced growth areas and InGa1-xAs compositions up to  $x = 0.25$ . Blanket areas with the same composition grading techniques exhibited randomly distributed threading dislocation-free regions approximately 30 microns in diameter, which were bounded by high-density dislocation pile-ups. ABSTRACT: (U) The primary objective of this research program was to investigate the effects of surface roughness on turbulent boundary layer heat transfer by obtaining accurate, comprehensive, quality heat transfer data for zero pressure gradient incompressible air flow over constant temperature test surfaces with well-defined surface roughness geometries. Knowledge gained from the experimental investigation was used to improve and extend the roughness energy transport model used in the discrete element prediction method, thus enhancing and expanding the capability to predict the effects of surface roughness on turbulent flow and heat transfer. Fluid dynamics and heat transfer data for turbulent boundary layer flow over a smooth and five rough surfaces were taken in the Turbulent Heat Transfer Test Facility (THTF) for x-Reynolds numbers ranging up to 10,000,000. The smooth wall data was used for qualification of the THTF and provided base line data for comparison with the data from rough surfaces.

DESCRIPTORS: (U) BASE LINES, BOUNDARY LAYER FLOW, ENERGY TRANSFER, FLUID DYNAMICS, HEAT TRANSFER, MODELS, PREDICTIONS, QUALITY, ROUGHNESS, SURFACE ROUGHNESS, TURBULENT BOUNDARY LAYER, TURBULENT FLOW.

UNCLASSIFIED REPORT

ABSTRACT: (U) Advanced elastic-damage and elastoplastic-  
damage models are presented within the frameworks of both  
continuum damage mechanics and micromechanical damage  
mechanics. Novel energy-based coupled elastoplastic  
continuum damage theories and computational algorithms  
are proposed, including rate-dependent isotropic and  
anisotropic damage models. Efficient constitutive  
algorithms and extensive experimental validations are  
also performed. In addition, novel finite deformation  
elastoplastic continuum damage models are developed to  
account for large strains and high rates. On the other  
hand, advanced and state-of-the-art two- and three-  
dimensional micromechanical anisotropic damage models are  
proposed to physically simulate micromechanical  
microcracking kinetics (cleavage 1 and cleavage 2  
processes) and damaged overall compliances for concrete  
materials under tensile and compressive loadings. These  
results are innovative, fundamental, and very useful in  
advanced damaged modeling. (JHD)

ABSTRACT: (U) This volume presents the contributions of the participants in the Sixth International Swarm Seminar, held August 2-5, 1989, at the Webb Institute in Glenn Cove, New York. The Swarm Seminars are traditionally held as relatively small satellite conferences of the International Conference on the Physics of Electronic and Atomic Collisions (ICPEAC) which occurs every two years. The 1989 ICPEAC took place in New York City prior to the Swarm Seminar. The focus of the Swarm Seminars has been on basic research relevant to understanding the transport of charged particles, mainly electrons and ions, in weakly ionized gases. This field that tends to bridge the gap between studies of fundamental binary atomic and molecular collision processes and studies of electrical breakdown or discharge phenomena in gases. Topics includes in the 1989 seminar ranged the gamut from direct determinations of charged-particle collision cross sections to use of cross sections and swarm parameters to model the behavior of electrical gas discharges. The range of subjects covered was in many respects similar to that of previous seminars. (js)

UNCLASSIFIED REPORT

ABSTRACT: (U) Research is underway into the application of martensitic transformations in ceramics to toughen a variety of ceramic-ceramic composites, i.e., to reduce their brittleness. The toughening agents of interest and their volume changes are dicalcium silicate (Ca<sub>2</sub>SiO<sub>4</sub>, 12%), nickel sulfide (NiS, 4%), lanthanide sesquioxides (Ln<sub>2</sub>O<sub>3</sub>, 8%) and lutetium borate (LuBO<sub>3</sub>, 8%). Ceramic processing routes have been developed to fabricate different types of toughened composites, viz., either by using a dispersed second phase microstructure or as a fine grained, single phase material. Specifically, Ca<sub>2</sub>SiO<sub>4</sub> has been dispersed in CaZrO<sub>3</sub> and the mechanical properties measured by bend tests. The critical importance of matrix toughness and grain size, as well as role of intergranular microcracking has been established. Dense pellets of fine grained, pure beta-Ca<sub>2</sub>SiO<sub>4</sub> have been sintered and their transformability by grinding established. Their microstructures were examined by TEM and preliminary micromechanical studies made on it, and on Gd<sub>2</sub>O<sub>3</sub>, by indentation and SEM techniques. NiS inclusions in glass were examined by TEM and EDS and a sol gel processing route to precipitate NiS in glass has been identified. Composites of Dy<sub>2</sub>O<sub>3</sub> in SiC and powders of LuBO<sub>3</sub> in B<sub>2</sub>O<sub>3</sub> have been fabricated.

UNCLASSIFIED REPORT

ABSTRACT: (U) The project proposal discussed two problem areas: (1) The solution of large sparse of linear equations; and (2) The solution of sparse least squares problems. We report significant progress in both of these areas and in a third area, the solution of the algebraic eigenvalue problem. The progress in solving systems of linear equations included an algorithm for computing ordering for efficiently factoring sparse symmetric, positive definite systems in parallel. We also made important progress in computing the ordering itself in parallel. Other progress included a method for handling singular blocks in a one-way dissection ordering and an error analysis of Gaussian elimination in unnormalized arithmetic. For linear least squares problems we developed an efficient reliable method for detecting the rank of a sparse matrix without column exchanges. The method used a static data structure. We also analyzed and compared methods for computing sparse and dense QR factorizations on message passing architectures. On the algebraic eigenvalue problem, we participated in resolving long standing open questions on relative perturbation bounds on certain diagonally dominant eigenvalue problems. (KR)

UNCLASSIFIED REPORT

**ABSTRACT:** (U) Three studies of temporal pattern perception were conducted. The listener's task was to determine whether or not two arrhythmic, tonal sequences formed the same temporal pattern. The first study tested the Pattern Correlation model. According to this model, the listener estimates the correlation between the pattern of time intervals marked by the tones in each sequence. Listener performance was characterized by an internal noise that is dependent on the average time between marker tones. The second study tested the effects of temporally compressing or expanding the stimuli. The transformations are common in speech and music; an important feature of temporal pattern perception is the ability to recognize patterns as similar, despite such transformations. An additional internal noise, proportional to the magnitude of the difference between the pattern transformations, was postulated to describe performance. In the third study, the stimuli were presented at different time delays and to separate earphone channels. At very short delays, waveform correlation is the likely comparison mechanism. At longer delays, pattern correlation is the probable mechanism, but this process is ineffective when the temporal patterns overlap. Keywords: Auditory, Perception, Pattern recognition. (emk)

UNCLASSIFIED REPORT

ABSTRACT: (U) Laboratory experiments, supplemented by approximate theoretical studies, have been carried out on the photochemical ignition of a flowing homogeneous gaseous fuel-oxidizer premixture by nonintrusive energy addition. In the experimental task, we have successfully demonstrated the ignition of H<sub>2</sub>/O<sub>2</sub> and CH<sub>4</sub>/O<sub>2</sub> mixtures with photolysis of NH<sub>3</sub> by use of an ArF laser at 193 nm. The theory, by a combination of numerical and approximate analytic methods, examines the interaction of premixture stoichiometry, preferential diffusion (i.e., differing diffusivities for heat and species), and flame radius, with respect to the outward propagation of a laminar flame from a single spheroidal kernel (if a flame develops). Previously reported observations of the variation of the flame-front speed with flame radius, sometimes interpreted in terms of preferential-diffusion effects but probably better interpreted in terms of radiative heat loss, have been examined; the need exists for further spherical-flame-propagation experiments, with emphasis on measurements taken when the flame radius is more nearly comparable to the flame thickness. UNCLASSIFIED REPORT

ABSTRACT: (U) This volume of proceedings contains manuscripts from Symposium G, entitled 'Impurities, Defects, and Diffusion in Semiconductors: Bulk and Layered Structures.' Historically, Symposium G was the seventh in a series of MRS-sponsored symposia which focused on various aspects of defects and defect properties in semiconducting materials. This symposium was conceived from the view that impurities, defects, and diffusion play key roles in modern-day research and development of semiconducting materials, structures, and devices. Recent breakthroughs in materials preparation with monolayer control, in diversity and sensitivity of characterization techniques, and in new theoretical methods, have collectively led to great advances in the understanding of defect- and impurity-related phenomena. (ttl)

ABSTRACT: (U) The II-VI compound semiconductors possess characteristics which, as a group, are unique. Among the most active areas of investigation in these materials today are blue light emitters based on ZnSe, infrared detectors based on mercury-containing compounds such as HgCdTe, and the properties of dilute magnetic semiconductors. Each of these areas is represented by several papers included in this volume. (ttl)

UNCLASSIFIED REPORT

ABSTRACT: (U) The MRS Symposium on In-Situ Patterning: Selective Area Deposition and Etching brought together a wide selection of microfabrication technologies and detailed studies of their enabling mechanisms. The common thread through the invited and contributed papers is the chemical and/or physical alteration of surfaces by the actions of ion, electron, or photon energy. The applications ranged from state-of-the-art lithographic techniques, to direct processing of semiconductor surfaces, aiming to obviate lithography in device fabrication. This direct processing encompasses patterned deposition of metallic conductors and insulating films, as well as local etching and doping of device structures. The work demonstrated in this symposium ranged from the detailed atomic behavior of treated surfaces, to nuts-and-bolts packaging techniques for the high-density descendants of today's printed circuit boards. (TTL)

UNCLASSIFIED REPORT

ABSTRACT: (U) Advanced ceramics and ceramic matrix composites play an increasingly important role in complex systems for structural, electronic, magnetic, and optical applications. This trend is expected to continue along with a specific goal to tailor composites that display spatial resolution in the micrometer and nanometer range. The fabrication techniques being used range from consolidation of submicron-sized powders to vapor phase deposition. The objective of this symposium was to review the progress made in the field and to identify the remaining critical issues to be solved through innovative processing approaches to improve the properties and reliability of advanced ceramics. In addition, this symposium was intended to complement the series of MRS symposia on Better Ceramics Through Chemistry from a physics and engineering point of view: powder synthesis and colloidal processing; sol-gel processing and ceramic/polymer composites; sol-gel processing of thin films and electronic ceramics; plasma-assisted processing and novel composites; fiber and whisker-reinforced composites. (ttl)

ABSTRACT: (U) This symposium comprised 11 invited talks and 42 contributed papers, ran over 3 1/2 days, and provided a unique and interactive forum in which recent advances in low dimensional magnetism, diluted magnetic semiconductors, epitaxial overlayers and the utilization of in-situ and ex-situ techniques to characterize their microstructure, electronic and magnetic properties were discussed. The study and growth of ultrathin magnetic structures is a rapidly expanding field of materials research whose growth is synergistically driven by an increasing appreciation of the degree to which the magnetic properties depend on interfacial processes, and by the utilization of growth techniques which permit the fabrication of multilayer structures with novel electronic and magnetic properties. Equally important is the fact that atomic level control of the microstructure of these layers offers new opportunities to elucidate the physics of magnetism and to rigorously test theoretical models. UNCLASSIFIED REPORT

ABSTRACT: (U) The intention of the editors was to bring together an interdisciplinary and international group of researchers working on various aspects of semiconductor heterostructures so that we could all learn from each other. In particular, we hoped to forge new links between those who study chemical interactions at heterostructure interfaces and those who are concerned with the effects of interfacial defects on the electrical and optical properties of semiconductor structures. The fact that there must be some relationship between chemical reactivity and defect formation has long been recognized, but as yet there is no detailed understanding of the actual mechanisms involved. Scientists studying either the causes or the effects of interfacial defects must appreciate all the issues and work closely with each other. Only through such collaboration can the formation of semiconductor interfaces be truly understood and, eventually, their properties controlled. If this Symposium and the resulting book have stimulated only a few such interactions, then we feel that our efforts have been successful. (TTL)

UNCLASSIFIED REPORT

ABSTRACT: (U) During the period covered by the grant over 20 research articles were written. Titles include: Identification of Cauchy Data in Nonlinear First Order Hyperbolic Systems, Control of Certain Dynamic Models of Beams and Plates, Identification of Elastic Parameters in von Karman Plate Models, and Identification of a Coefficient of Conductivity from Potential Measurements.

ABSTRACT: (U) The principal results of the research are two-fold. First, the time-dependent behavior of electron swarms in various atomic and molecular gases were obtained using a novel numerical procedure. The electrons injected in the gaseous source excite and ionize the atoms as well as molecules and, more importantly, cause dissociation and vibrational excitation of the molecular species. Second, the cross sections and the rates of negative ion production via the process of dissociative electron attachment to various light molecules were calculated. The role played by initial rovibrational excitation of the molecule in enhancing the rates of production of negative ion beams were investigated in detail. Since the processes of dissociative attachment and vibrational excitation are complementary in nature (both proceed via the excitation of molecular hydrogen and its five isotopes were also examined. Very useful scaling law for these excitation cross sections were for vibrational excitation or deexcitation, by electron impact, of heavier isotopes of H<sub>2</sub> from the corresponding sections for molecular hydrogen. Keywords: Atomic, Molecular, Gases, Electron, Isotopes. (JHD)

ABSTRACT: (U) This program has produced detailed information concerning the chemical behavior of halogen isocyanate, halogen amine, and halogen azide systems. These types of molecules can store considerable amounts of energy, which can be released by photolysis, chemical reaction, or energy transfer processes. In a number of the particular cases studied, the energy release was strongly constrained by angular momentum conservation rules. The data obtained from this program are relevant to the development of new laser systems, new propellants, and the understanding of combustion processes. (TTL)

ABSTRACT: (U) This report summarizes a body of research dealing with the nonlinear control theory of complex mechanical systems. The principal focus is on the dynamics of rotating systems with uncontrolled degrees of freedom, and we treat specific model problems of pointing, shape, and orientation control of complex spacecraft in a zero gravity environment. We also examine the dynamics of rotating kinematic chains. The list of references in this report cites all our major contributions to the literature of rotational mechanics. Two papers in particular--'Rotational Elastic Dynamics' and 'Equilibrium Mechanics of Rotating Systems' form the principal basis for the present report. Indeed, these papers are reproduced here with occasional remarks and comments inserted regarding very recent developments in the field. Keywords: Space structures, Aerospace, Engineering, Mathematical theory. (Author) (KR)

ABSTRACT: (U) Five studies were completed: (1) It was found that, following repetition, long period (500 ms) random waveforms excised from Gaussian noise could be identified when embedded in longer segments of Gaussian noise even when the inter-stimulus interval exceeded the limits of echoic memory; (2) It was demonstrated that some spectral regions of these long-period random waveforms could be recognized with greater accuracy than others; (3) Experiments with three consecutive odd-numbered harmonics demonstrated that triads with low fundamental of the harmonic series, but triads centered at the 9th or 11th harmonic had pitches roughly one octave higher. Deviations from the octave were consistent with the waveform pseudoperiodicities. These pitch judgements have implications for theories concerning the bases from the dominant region of complex tones. Two series of experiments involving (4) the vowel conversion effect and (5) dichotic verbal transformations, which compared the rules governing perceptual organization of speech in Japanese and English, were carried out by the principal investigator during May and June at the Basic Research Laboratories of the Nippon Telegraph and Telephone Co., Tokyo. Keywords: Auditory perception, Complex sounds. (RH)

UNCLASSIFIED REPORT

ABSTRACT: (U) The effects of acceleration on vortex growth and molecular mixing have been systematically explored for the first time in a transverse array of exponentially increasing jets. The issue is the influence of a new kind of forcing which imposes on a vortex a time scale from an exponential rather than a sinusoidal wave. The results are that such forcing dramatically reduces the normalized size of the vortex. Therefore the capacity for mixed fluid inside the vortex is also reduced, by about a factor of eight at large acceleration. Keywords: Transverse jets, Turbulent mixing, Accelerating flows. (SDW)

ABSTRACT: (U) Chaotic behavior is studied in a high-dimensional periodic lattice version of the classical Hamiltonian phi-four field theory. Both single and double well potentials were considered. Examined is the existence of a global stochasticity threshold that varied with energy and initial conditions. The model was discretized using an algorithm due to Hirota that guarantees stability and energy conservation. Chaotic behavior was diagnosed using the Lyapunov exponent, with additional information from space-time profiles, Fourier power spectra, and phase space plots. Long time scales made it difficult to distinguish between asymptotically chaotic and integrable behavior. (jhd)

ABSTRACT: (U) In this project questions related to stabilization of vibrating system by feedback were studied. A vibrating system is uniformly stabilized by a feedback if there is a uniform rate of decay for all vibrational modes of the closed-loop system, which is the system with feedback. Necessary conditions were found for certain kinds of feedback to uniformly stabilize a system which is originally undamped and has the feedback applied at the boundary. Sufficient conditions were found for the feedback to lead to a closed-loop system which is mathematically well-posed. It was also shown that in a large class of systems which are stabilized by feedback, if a small delay is introduced in the computation of the feedback, then the stability of the closed-loop system is destroyed. Keywords: Robust stabilization. (KR)

ABSTRACT: (U) Brittle and ductile isotropic damage mechanisms are studied from a meso-mechanical view point. Relationships between crack density and void volume fraction defined at meso-scale on one hand, and a scalar internal variable characterizing damage on the other hand, are given. A general form for the evolution law for this damage variable is also derived from the same approach. A threshold which defines the onset of this evolution is derived from thermodynamical considerations. The ultimate stage of this evolution, i.e., the local failure is derived from localization criteria. (JS)

UNCLASSIFIED REPORT

ABSTRACT: (U) On March 12-13 an interdisciplinary group of thirty-five, composed of computer scientists, experimental psychologists, linguists, philosophers and connectionists met to share views on representations and their role in mental models. Although at least two books and several papers directly address these issues, the nature of mental models is far from clear. The meeting shed some light on why understanding mental models is difficult. Simply put, the reason is that mental processes are described in many different ways and a quite different levels of abstraction, depending upon the researcher. For example, some emphasize the cognitive properties of mental models, whereas others are more concerned with the internal data structures. Still others may stress the logical form and content of the mental process, as contrasted with the actual computational machinery. The diversity of these viewpoints is clear upon reading the abstracts prepared by the participants. Further study is needed to examine how these diverse viewpoints fit together into a useful, integrated framework. Keywords: Artificial Intelligence, Cognition, Data structure, Knowledge representation, Language, Mental models, Neural nets, Perception, Reasoning. (KR)

ABSTRACT: (U) By solving the transport equations for the amplitude of the progressing wave expansion of Maxwell's equations using the Lorentz model, the amplitudes, do not decay exponentially along the ray. Thus, one now studies more general models of the dispersive media, to determine the qualitative features for which the amplitudes do, or do not decay exponentially. Preliminary results suggest that a classification of dispersive media is obtained depending on the relative orders of the differential operators. (jhd)

UNCLASSIFIED REPORT

ABSTRACT: (U) During this research effort, the concept of using a high-speed scanning electron microscope (SEM) observer real-time microstructural response of dynamically loaded structural materials was verified experimentally at a maximum framing rate of 381 Hz (256 horizontal pixels x 128 vertical pixels), about order of magnitude higher than previously possible with conventional SEM's. This experiment accomplishment proved the soundness of several key concepts: (1) That a tungsten hairpin cathode is bright enough to obtain useful digital images at the framing rate listed above; (2) that a secondary electronic detector can be built and operated at high enough count rates to obtain such images; (3) that the scan can assembly standard on an ISI SX-40A SEM can be replaced to allow imaging at such rates with spot resolution approaching 100nm; (4) that signal acquisition and scan generation can be synchronized to obtain a succession of well-defined frames in a 'movie' format at pixel rates far in excess of convention TV-rate SEM video bandwidths; and (5) that a magnetically-induced stress wave device can be used obtain dynamic fracture within the SEM chamber and field of view, with scanning timed to coincide with fracture. Also documented herein are unanticipated results which occurred during the research period. (ttl)

## UNCLASSIFIED REPORT

ABSTRACT: (U) An objective of the Conference and related Topical Symposia has been to bring together scientists, worldwide, who work in various fields of the science and technology of sintering and sintered materials. These conferences typically attract about 200 participants from 25 or more countries of the world. Such conferences represent the premier forum for discussions of all aspects of the science of sintering and have historically attracted most of the leading scientists and a significant number of younger sintering scientists. The International Program Committee for the VIIth Conference, for example, had leading sintering scientists from 23 countries, including six from the U.S. (R.L. Coble, R.M. German, D.L. Johnson, G.C. Kuczynski, H. Palmour III, and R.M. Spriggs as President of the Committee). Given its location in Yugoslavia, the Conference has also provided an unusual opportunity for international interactions. UNCLASSIFIED REPORT

ABSTRACT: (U) A symposium entitled 'Polymer Based Molecular Composites' was organized as part of the Materials Research Society Fall Meeting Held November 27-30, 1989 in Boston, Massachusetts. A total of 57 papers were presented during the symposium. The papers were arranged in the following eight categories: (1) Inorganics/Emulsions; (2) Emulsions/Blocks; (3) Rigid-Flexible Systems; (4) Blends/IPN's; (5) Ionomers/Structure; (6) Synthesis/Electrooptical Properties; (7) Interfaces/Mechanical Properties; (8) Miscellaneous/Conventional Composites. Two papers were recognized by the symposium organizers with awards as outstanding contributed papers. Two other papers in the symposium were recognized by the Materials Research Society with Graduate Student Awards to their presenters. (JS)

ABSTRACT: (U) It was attempted to deposit hard carbon films using the ionized cluster beam deposition method with organic materials. The principle idea was to have the organic molecules to decompose on impact with the substrate. A major problem involved the decomposition of organic starting material in the crucible. It was hoped to use lower crucible temperatures to reduce decomposition. Increased crucible temperatures were eventually used to increase the deposition rate. This resulted in more hydrogen in the chamber and the 50 I/s turbomolecular pump was unable to maintain a pressure below about 8 x 10<sup>-4</sup> torr. Changes and experiments are being made, but to date the endeavor has been unsuccessful. Ion composition, Deposition beam, Organic chemistry. (JS)

ABSTRACT: (U) The Research Approach and Objectives were to: To develop robust theoretical model for a wide class of electro-optical systems; to extend the known capabilities, by design of new, more efficient algorithms for electro-optical computing using less time, volume, and energy. In particular, to develop efficient algorithms that use optimal combinations of time, volume, and energy on electro-optical computing systems; and to determine the fundamental theoretical limitations and capabilities of electro-optical computing systems. In particular, to determine lower bounds on tradeoffs between volume, time and other resources (such as energy) of any electro-optical computing systems to solve fundamental problems. (KR)

ABSTRACT: (U) Significant progress is reported on analytical and computational methodology applicable to dynamics and control of flexible multibody structures. Especially significant are the following: (1) We have developed new analytical and numerical results pertaining to imposing constraints in multi-body dynamical modeling and numerical simulation. We have developed an extension of existing penalty methods for constrained multibody dynamics, including some significant convergence proofs. (2) We have developed a power principle which permits the efficient construction of stabilizing control laws for systems described by nonlinear systems of coupled ordinary and partial differential equations. (3) We have initiated a study of symbol manipulation methods to derive polynomial-type nonlinear feedback control laws for dynamical systems with polynomial nonlinearities. A general MACSYMA symbolic computer code has been developed and studies are under way on several test problems. Keywords: Maneuvers, Variation, Control. (kr)

ABSTRACT: (U) The propagation of rf waves launched in the end cell and central of the tandem mirror propulsion device has been investigated both theoretically and experimentally. Theoretically, a computer code has been developed to study the wave propagation in a nonhomogeneous magnetic field. It was found that the amplitude of the wave excited in the plasma peaked while approaching the resonance, but then damped out, indicating strong absorption of the wave by the plasma. The absorption took place near the axis and midplane of the device. The experimental results confirmed the theoretical prediction of the phenomena of the resonance effect. This means that the rf power is heating the plasma in center contrary to the earlier prediction that the heating was near the edge. Therefore higher efficiency can be possible. A very important discovery of this experiment was the broadening of the ICRF Fourier spectrum in the presence of the plasma. (kr)

ABSTRACT: (U) The objective of this research is to determine the interface properties needed for successful metal matrix composites and to learn how to achieve these properties. A number of factors have been selected for the study. These are thermodynamic stability of the interface, nature of the bonding across the interface, energy and structure of the interface, and role of adsorption at the interface. A number of systems have been chosen to probe these factors; namely, Al/TiC, Al/alpha-Al<sub>2</sub>O<sub>3</sub>, Al/MgAl<sub>2</sub>O<sub>4</sub>(spinel), Al/Al<sub>3</sub>(Ti, Zr)-x), Mg/SiC, Mg/MgO, and Mg/Al<sub>2</sub>O<sub>3</sub>. Techniques for preparing all of these composites have been worked out, including mechanical alloying followed by extrusion, arc melting, and liquid metal infiltration. MMCs also were obtained from Martin Marietta and Dow. Microstructures of the resulting MMCs are presented and discussed along with preliminary studies of some of the interfaces using transmission electron microscopy. In comparison to Al/SiC, Al/TiC and Mg/SiC show no evidence of chemical reaction at the interface during processing. Al/MgAl<sub>2</sub>O<sub>4</sub>(spinel) has superior mechanical properties to Al/alpha-Al<sub>2</sub>O<sub>3</sub>, both prepared identically. (Author) (tr)

ABSTRACT: (U) These studies have been part of an ongoing research program on the ability to certain nutrients to affect the production of their neurotransmitter products, and thereby to affect behaviors and other brain functions (e.g., control of blood pressure). The studies have focused on the amino acid tyrosine - which is converted, in neurons or chromaffin cells, to dopamine, norepinephrine, and epinephrine. The effect of supplemental tyrosine on brain dopamine release has now been shown directly, using the new technique of in vivo microdialysis. Hemorrhage, per se, has been shown to raise neuronal tyrosine levels, probably reflecting a protective mechanism to sustain blood pressure. Adenosine and the amino acid alanine have now also been shown to modulate blood pressure - and adenosine to mediate some of the fall in blood pressure caused by hemorrhage. Various dipeptides & diketopiperazines have been shown to enhance dopamine release, either by providing tyrosine or by direct actions. Keywords: Tyrosine; Nutrient; Catecholamine, Serotonin; Behavior. (js)

UNCLASSIFIED REPORT

ABSTRACT: (U) A conference was held on February 2-3, 1990, in Atlanta on the Emory campus on the topic of Affect and Flashbulb Memories. Fourteen speakers presented their research or discussed research presented by other conferees. The primary focus was on flashbulb memories of the Space Shuttle Challenger explosion of January 1986. Research was reported concerning peoples memories for information related to the disaster, including memory for their personal circumstances surrounding how they heard the news as well as their memory for the facts of the event. Primary attention was given to whether a special memory mechanism underlies vivid memories, whether these memories are established immediately at the time of the event rather than in subsequent recounting, whether these memories are as accurate as is presupposed by the flashbulb metaphor, and to the relationship between affect and memory. The results of the conference will be published as an edited volume in 1991 Cambridge University Press. Keywords: Emotions; Disasters; Memory (psychology). (Author) (emk)

ABSTRACT: (U) A computational model was used to improve the learnability of an Air Force document, doubling recall and greatly improving recruits' mental representation of the content. Kintsch's computer model of reading was applied to a 1000 word Air Force text on the Air Force's role in Vietnam War. Principles of the model were used to identify 40 text locations where recruits would have to make inferences if they were to have a coherent mental representation of the text. Each location was then repaired, and the repaired text was then tested for learnability against the original text in two experiments. In experiment 1, free recall was doubled for the repaired text. In the second experiment, 120 recruits' 66-part mental representations for 12 important text concepts were measured, and compared with the mental representations of the text's author, and of 7 independent subject matter experts. The author and the experts' mental representations correlated about .80. For recruits who read the repaired text, their mental representations correlated with the author and experts about .55 =  $N < 0.05$ . But recruits who read the original text correlated with the author and experts only about .10. These results suggest that the computational model can be used to improve the learnability of Air Force tests. Individual differences tests of interfering

## UNCLASSIFIED REPORT

ABSTRACT: (U) The saccadic control system to study the selection of stimulus events according to their spatial location. The present work focuses on two factors known to influence saccade latency: the presence of a fixation stimulus and the nature of the saccade target. We report evidence which suggests that fixation point offsets facilitate pre-motor stages of saccade generation (Reuter-Lorenz et al., in press; Appendix I). This idea, in conjunction with electrophysiological data, suggested that fixation offset might also facilitate saccades to acoustic targets. Experiment 1 confirmed this suggestion (Fendrich, et al. (in preparation)). The facilitatory effects of redundant stimulation via the visual and auditory modalities is examined in Experiment 2 (Nozawa et al., 1990). The data suggest significant neural summation, which we attribute to bimodal convergence onto individual cells thought to mediate saccadic command functions. (js)

ABSTRACT: (U) The effects of a single intramuscular atropine injection (0.03 mg/kg) at ambient temperatures (Ta) of 25 C and 35 C and pyridostigmine treatment (5 doses (0.4 mg/kg)) at Ta of 35 C on the thermoregulatory capacity and exercise tolerance time of patas monkeys were investigated. A primate treadmill device was developed and used to evaluate the effects of the drugs on the exercise tolerance time. Rectal temperature (Tre) and heart rate (HR) were continuously monitored by a telemetry system while water loss was estimated from weight differences before and after exercise. Atropine effects were more pronounced at Ta of 35 C as indicated by a significant reduction in water loss (43%) which was associated with an average exercise time of 65 min less than the control value. The final HR and Tre responses in these atropine experiments were significantly elevated above the control values. Pyridostigmine significantly increased water loss (61%) which was associated with an average exercise time of 60 min longer than the control value. (js)

UNCLASSIFIED REPORT

**ABSTRACT:** (U) The overall goal of this research project is to systematically investigate a number of the possible through which presynaptic modulation might influence the effectiveness of local synaptic interactions at the mammalian hippocampal mossy fiber synapse. The potential significance of this research has been dramatically highlighted by the events of this past year, in which several different laboratories conclusively demonstrated that long-term potentiation (LTP) in the mossy fiber-CA3 synapse involves an enhancement of neurotransmitter release (Bekkers et al., 1990; Malinow and Tsien, 1990; Staubli et al., 1990; Zalutsky and Nicoll, 1990). The LTP of synaptic transmission in the hippocampus is a widely studied model system for understanding the cellular mechanisms of memory and synaptic plasticity. Thus, a definitive link has now been established between mossy fiber synaptic plasticity and the presynaptic modulation of this synaptic input. Specifically, any factor that is capable of enhancing or suppressing the release of mossy fiber transmitters will have a predictable effect on the probability that LTP is maintained in the mossy fiber-CA3 synapse. **Keywords:** Presynaptic, Hippocampus, Mossy fiber, Long-term potentiation, Glutamate, Dynorphin. UNCLASSIFIED REPORT

ABSTRACT: (U) Both NO and CO preferentially chemisorb on step sites of the Pt(112) crystal orienting the intermolecular bond in the downstairs direction. Using the digital electron stimulated desorption-ion angular distribution method (ESDIAD), an elliptical angular distribution of the desorbing  $+$  ions was detected from the NO/Pt(112) system with the longer axis of the ellipse normal to the step-edge direction. On the other hand, the  $+$  ESDIAD pattern from the CO/Pt(112) system shows an approximately cylindrical symmetric shape. Heating of the crystal leads to broadening of the ion desorption patterns in both cases without change in the patterns' elliptical or circular cross-sectional geometry. These results are interpreted as being due to ion desorption from NO molecules bonded to two Pt atoms on the step edge and vibrating with a longer amplitude in the vibration is approximately the same in directions parallel and perpendicular to the step edge. Thus, in certain cases ESDIAD patterns may be used to determine the hybridization state of adsorbates. (ttl)

#### UNCLASSIFIED REPORT

**ABSTRACT:** (U) High-Tc superconductors have been investigated in both bulk and thin film form. A technique for the in-situ preparation of high-Tc superconducting films involving the use of ozone-assisted Molecular Beam Epitaxy has been developed. The procedures seem to be generalized to the extent that high quality trilayer and multilayer structures which would be useful scientifically and technologically are possible. In addition to the process working with the usual substrates, it has been possible to deposit films on Si substrates without any buffer layer. A bolometer has been successfully fabricated on a thermally isolated SiN substrate coated with YSZ. Very thin and transparent films with relatively high transition temperatures have been prepared. The magnetic properties of bulk polycrystalline and single crystal high temperature superconductors have been measured and reveal important features of flux pinning and anisotropy in these materials. A low temperature scanning tunneling microscope for the investigation of the surfaces of high-Tc superconductors has been developed. Keywords: Superconductivity. Materials, Thin films. (js)

ABSTRACT: (U) DIMEX (Dipole Plasma Microwave Exposure) experiment has demonstrated both stable confinement of plasma at electron densities of the order of  $10^{10}$  to the  $11^{th}$  power and electron temperatures of 1 eV and also has demonstrated strong absorption of 1 GHz microwaves with much reduced reflection (-10dB). In addition, high-intensity microwaves (greater than 0.1 W/sq cm) were strongly reflected, indicating that the plasma shell can function as a cloak to radar and a shield to HPM. It is believed that the successful demonstration of plasma confinement, cloaking to low-intensity microwaves, and even shielding to high-intensity microwaves can be explained in terms of existing theory, drawn from the magnetic and laser fusion communities. UNCLASSIFIED REPORT

ABSTRACT: (U) This activity focused on the effect of density variation due to temperature/molecular weight difference and/or heat release in a reacting shear layer in two and three dimensional configurations. In the spatially growing 2D layer, results confirm mixing asymmetry due to density difference between the two streams. A light fast stream has a destabilization effect on the early stages of development; it promotes early roll-up; induces stronger winding inside the eddies, and initiates the pairing at earlier stages. However, the overall spatial growth rate of the layer increases as the density ratio becomes higher; bigger eddies are formed and pairing is completed faster. In 3D simulations, density difference continues to impart a convection velocity on the structures in the direction of heavy mixing. That influences the evolution of the streamwise mixing modes and spanwise preferential entrainment is observed. 3D reacting shear layer simulations confirmed earlier 2D observations that although the reaction zone structure depends on the Damkohler number, product distribution is independent of the kinetic parameters and exhibit strong resemblance to the vorticity field. UNCLASSIFIED REPORT

ABSTRACT: (U) Work was focused on paraoxon, a direct inhibitor of acetylcholinesterase (AChE) and a potent toxicant on the cholinergic nervous system. While paraoxon inhibits AChE in all tissues, the tissue in which inhibition results in death is not known for certain. It is clear that death after acute paraoxon poisoning results from asphyxiation. The dose of paraoxon at cessation of breath (CoB) average 5.7 mg/kg at all infusion rates, which suggests that the same site of action and mechanism for paraoxon-induced CoB was in effect at all infusion rates. While heart AChE activity at CoB was independent of the infusion rate, heart appeared not to be the sensitive site since it was pumping blood at CoB. A site of action consistent with the data was CNS outside the blood-brain barrier. With low infusion rate most of the total brain AChE was inhibited. With increasing infusion rate, inhibition of total brain AChE activity would decrease, due to less time for paraoxon to penetrate the BBB; the extra-BBB site would always be rapidly inhibited. Heart and diaphragm AChE was at the level observed at CoB while inhibition of brain AChE increased with increasing dose, again indicating brain as the sensitive site. (JS)

ABSTRACT: (U) A multichannel iteration technique was developed to obtain accurate results for phase shifts from a 'smooth' Schwinger K matrix. Applications were made to e + He+ phase shifts in one, two, and three channel approximations. A second project was started to study excited states of helium using dimensional analysis. A moment method is being used to solve the two-electron Schrodinger equation generalized to an arbitrary number of dimensions. Keywords: Helium. (kr)

ABSTRACT: (U) Pictures help people to comprehend and remember texts. We report two experiments designed to test among several accounts of this facilitation. Students read texts describing four-step procedures in which the middle steps were described as occurring at the same time, although the verbal description of the steps was sequential. A mental representation of the procedure would have the middle steps equally strongly related to the preceding and succeeding steps (because the steps are performed simultaneously), whereas a mental representation of the text would have the middle step that was described first more closely related to the preceding step than the middle step described. After reading, strengths of the represented relationships between the steps were assessed. When the texts were accompanied by appropriate pictures, subjects tended to mentally represent the procedure. When the texts were presented alone or with pictures illustrating the order in which the steps were described in the text, subjects tended to mentally represent the text. We argue that these results disconfirm motivational, repetition, and dual code explanations of the facilitative effects of pictures. The results are consistent with a version of mental model theory that proposes that pictures help to

ABSTRACT: (U) This report describe the progress on the development of a new laser based combustion diagnostic for the quantitative measurement of both major and minor species in high pressure flames. The technique, Asynchronous Optical Sampling (ASOPS), is a state of the art improvement in picosecond pump/probe spectroscopy. Final results from the study of atomic sodium in an atmospheric flame are presented. The first ever UV pump/UV probe ASOPS signal for atomic indium is shown. Techniques for noise reduction are discussed along with initial results. Keywords: Probe spectroscopy; Combustion; Laser diagnostics; Stimulated emission. (jhd)

ABSTRACT: (U) A microcomputer based Property Estimation Program (PEP) and Database (DB), utilizing molecular connectivity indices (MCI)-property and property-property correlations, as well as UNIFAC derived activity coefficients, has been designed to provide both experts and non-experts with a fast, economical method to estimate compound aqueous solubility, octanol/water partition coefficient, vapor pressure, organic carbon normalized soil sorption coefficient, BCF, and Henry's Law constant for use in environmental fate modeling. The user can input the required structural information using either Simplified Molecular Input Line Entry System (SMILES) notation or connection tables generated from two commercially available two-dimensional drawing programs, ChemDraw or ChemIntosh. Estimates of predictor accuracy are provided along with the estimated property values. The development and current status of the PEP-DB program is described. (JS)

UNCLASSIFIED REPORT

ABSTRACT: (U) Two - phase Materials are technologically  
important because optimum properties can be obtained by  
proper combinations of phases. Among these materials, two-  
phase Titanium Alloys are of particular interest for high  
temperature aerospace applications. To design new alloys  
or to optimize the properties of existing Titanium alloys,  
it is essential to understand the deformation behavior  
and microstructure evolution of alpha, alpha-beta and  
beta Titanium alloys which is the subject of this  
investigation. Another aspect of this investigation is to  
determine the effect of strength difference between  
phases on deformation behavior of two-phase materials by  
the Finite Element Method. It was found that the flow  
stress drops followed by steady state behavior observed  
in beta titanium alloys strongly depend on pre-strain,  
prior heat treatments, and amount and nature of alloying  
elements. The flow stress drops were attributed to the  
multiplication of mobile dislocations and the steady  
state behavior was attributed to the dynamic recovery  
leading to the formation of subgrains. (tt1)

UNCLASSIFIED REPORT

ABSTRACT: (U) This work has addressed the question: What is the effect of nonequilibrium chemical reactions on separated hypersonic flow? The model used to generate the separate flow is a hypersonic shock wave/boundary layer interaction on a flat plate in a high enthalpy flow. The flow was calculated by means of a finite-difference, time-marching solution. The results show that nonequilibrium effects can be important in the separated flow region, and that future applications should be aware of such effects. Keywords: Separated flow, Nonequilibrium, Shock-wave/boundary layer, Boundary layer interaction. (JS)

ABSTRACT: (U) This Report summarizes the results of a research program focused on the distress of cementitious composites exposed to aggressive chemical substances found in nature. It presents a comprehensive summary of constituent physico-chemical processes such as diffusion with adsorption, kinetics of chemical reactions, stresses attributable to expansive reaction products and attendant microcracking. Formulated analytical model was checked against available experimental data. The accuracy with which these data were duplicated is considered to be exemplary at this stage of the model development. (tt1)

UNCLASSIFIED REPORT

ABSTRACT: (U) The dynamic stall characteristics of several airfoils in sinusoidal pitch oscillations as well as in constant rate pitch ramps over a wide range of unsteady flow conditions have been investigated. It is found that the flow before the onset of stall can be considered quasi-steady and predicted using inviscid theory, that the effect of unsteadiness on the onset of dynamic stall depends on the airfoil geometry and whether the flow has become locally supersonic, and that the effect of the freestream Mach number on the onset is rather insensitive to the airfoil geometry. Our analysis on both experimental and numerical results predicts the presence of a separation bubble at the leading edge. It also suggests that the bursting of the bubble, or failure to reattach after the initial separation, is the onset mechanism for most of the dynamic stall cases studied. The effects of transition on bubble bursting (the onset of massive separation of dynamic stall) are studied numerically by choosing the location at which the turbulence model is switched from molecular to turbulent eddy viscosity in the numerical code. It was found that at angles of attack close to the static stall angle, minor movements in the transition point could cause a separation bubble to burst, and that bubble bursting is more susceptible to transition point location in a

ABSTRACT: (U) This report summarizes results obtained in the study of how waves are reflected and transmitted by a randomly layered medium. Temporally pulsed energy (plane wave, beam or radiated energy from a localized source) illuminates this material. Work that was initially done for the acoustic problem has been extended to the electromagnetic problem. An extensive simulation study has confirmed the applicability of this theory. Recent work has considered radiation from a monochromatic point source in the presence of a randomly layered medium. (jhd)

ABSTRACT: (U) A computational model was used to improve the learnability of an Air Force document, doubling recall and greatly improving recruits' mental representation of the content. Kintsch's computer model of reading was applied to a 1000 word Air Force text on the Air Force's role in Vietnam War. Principles of the model were used to identify 40 text locations where recruits would have to make inferences if they were to have a coherent mental representation of the text. Each location was then repaired, and the repaired text was then tested for learnability against the original text in two experiments. In experiment 1, free recall was doubled for the repaired text. In the second experiment, 120 recruits' 86-part mental representations for 12 important text concepts were measured, and compared with the mental representations of the text's author, and of 7 independent subject matter experts. The author and the experts' mental representations correlated about .80. For recruits who read the repaired text, their mental representations correlated with the author and experts about .55 =  $N < 0.05$ . But recruits who read the original text correlated with the author and experts only about .10. These results suggest that the computational model can be used to improve the learnability of Air Force tests. Individual differences tests of interfering

ABSTRACT: (U) Significant advances have been made in understanding the observability problem for systems with chaotic or otherwise complicated dynamics. Rigorous connections have been established between the theory of stochastic noise and observations of deterministic dynamical systems which are chaotic or otherwise display a complicated dynamical structure. New techniques have been developed for implementing state estimation of chaotic dynamical systems in the presence of observational noise. A general sufficient condition has been established for the observability of a benchmark class of chaotic dynamical systems, the Anosov diffeomorphisms. (JHD)

ABSTRACT: (U) In investigating the effects of magnetic field on the output power of a plasma filled Backward Wave Oscillator, it was found that within a certain range of magnetic field the growth rate of beam plasma cyclotron interaction is significantly larger than the conventional backward wave oscillation. Computer simulations of a 100 GHz electron cyclotron autoresonance master oscillator have been carried out. Keywords: Backward wave oscillator; Cyclotron autoresonance maser. (jhd)

ABSTRACT: (U) The aim of this research has been to develop stochastic network processes for modeling the movement of discrete units in networks. Primary examples are the movement of data packets in computer networks, the movement of parts and supplies in manufacturing plants or in military support systems, and the movement of smart cars and trucks on electronically monitored highways. The distinguishing feature of our research is the emphasis on the next generation of intelligent networks that will be the backbone of our computer, military and transportation systems. Most of the present theory of stochastic network processes is for unintelligent networks in which the nodes operate independently, the routes of units are independent and the units move one at a time. In an intelligent network, however, the processing at the nodes and the routing typically depend dynamically on the actual congestion, and units move concurrently. Examples of dependencies are routing units to avoid congested nodes, speeding up of processing as queues grow, splitting and merging of units, batch processing and distributed as parallel processing. Our general goal is to provide an understanding of intelligent networks by describing their stochastic behavior. (kr)

ABSTRACT: (U) 1) Research Objectives: -- To study the  
underlying principles, architectures and applications of  
artificial neural networks for intelligent computations.  
2) Approach: -- We use both numerical simulation and  
theoretical analysis to investigate various alternatives  
in connection schemes, organization principles and  
architectures of artificial neural networks. 3) Progress  
for period 9/1/88-8/31/89: -- In the past year, our  
research on neural network models for intelligent  
computing under the sponsorship of AFOSR continues to  
make important progress. In particular, we have  
constructed the Parallel Sequential Induction Network, a  
powerful network that self-organizes into an optimal  
structure to perform classification tasks. In neural  
network research, much attention has been paid to  
improving the efficiency of learning connection weights  
for a network with fixed topology. However, little  
progress has been made toward uncovering optimal  
designing principles to reshape the connection topology  
of a network adaptively to maximize the performance of a  
specific task. Recent studies indicate that multi-layered  
feedforward networks of sufficient complexity, in general,  
need only two hidden layers to imitate any decision  
hypersurface in the pattern space. (kr)

SUPPLEMENTARY NOTE: Sponsored in part by grant NSF-EC89-13351.

ABSTRACT: (U) For high dimensional or nonlinear problems there are serious limitations on the power of available computational methods for the optimization or parametric optimization of stochastic systems of diffusion type. The paper develops an effective Monte Carlo method for obtaining good estimators of systems sensitivities with respect to system parameters, when the system is of interest over a long period of time. The value of the method is borne out by numerical experiments, and the computational requirements are favorable with respect to competing methods when the dimension is high or the nonlinearities 'severe'. The method is a type of derivative of likelihood ratio method. For a wide class of problems, the cost function or dynamics need not be smooth in the state variables; for example, where the cost is the probability of an event or sign functions appear in the dynamics. Under appropriate conditions, it is shown that the invariant measures are differentiable with respect to the parameters. Since the basic diffusion

SUPPLEMENTARY NOTE: Pub. in Jnl. of Physical Chemistry, v94 n18 p7200-7205, 1990.

ABSTRACT: (U) Efficient excitation transfer from N<sub>2</sub>(A) and CO(a) to OH has been observed in a room-temperature flow reactor. The excitation-transfer rate constants for OH(A<sup>2</sup>Sigma<sup>+</sup>) formation are (9.5 + or - 1.9) X 10 to the minus 11 power cc/mole/s for N<sub>2</sub>(A) and CO(a), respectively. These values suggest that excitation transfer makes the dominant contribution to the total quenching of N<sub>2</sub>(A) and CO(a) by OH. The OH(A) molecules are formed with high rotational energy. Preliminary experiments show that excitation transfer from N<sub>2</sub>(A) to CH<sub>3</sub>O occurs, but the rate constant is smaller than for OH. Quenching of N<sub>2</sub>(A) by SH and SF gave no SH(A-X) or SF(A-Z) emission. The excitation mechanism and the potential surfaces for the OH(A) excitation are qualitatively discussed. (ttl)

ABSTRACT: (U) Samples of transparent silica gels of controlled porosities are produced stabilized at 800 C. Raman spectra of samples impregnated with CS<sub>2</sub>, CHCl<sub>3</sub>, CH<sub>3</sub>CN, or acetone are recorded in order to obtain rotational and vibrational correlation functions and correlation times for those liquids. The effect of pore diameters on vibrational dephasing and rotational diffusion is discussed. It is shown that surface interactions, in particular, hydrogen bonding between the imbedded molecules and silanol groups, are responsible for slowing down the rotational relaxation within small pores. A simple model for reorientational motion of molecules hydrogen bonded to the silica surface is proposed. The vibrational modulation times are obtained from the Kubo theoretical function and used to analyze molecular interactions near the silica surface. The number of silanol groups on the surface is estimated from the C=O band of acetone. Keywords: Silica gels, rotational relaxation in pores, Reprints. (JS)

ABSTRACT: (U) The main objectives of the completed work are to develop mathematical techniques to reduce the dimensionality of multidegree-of-freedom nonlinear systems near bifurcation points and to solve for the response statistics of the reduced system. The asymptotic behavior of nonlinear dynamical systems in the presence of noise is studied using the method of stochastic normal forms. The crucial point in the normal form computations is to find the resonant terms that cannot be eliminated through a nonlinear change of variables. Subsequent to reduction of the dimensionality, a Markovian approximation is used to obtain the associated stochastic normal forms. The key result is that the second order stochastic terms have to be retained in the normal form computations in order to capture the contributions of the stable modes stochastic components to the critical modes drift terms. It is also shown that the method of extended stochastic averaging is in fact 'equivalent' to stochastic normal forms for a specified class of nonlinear systems. In addition, mean square stability of

the response is obtained and the bifurcation behavior and associated stationary and transient probability density functions for the reduced stochastic system are determined. Finally, the general results are applied to the study of the dynamics of aircraft at high angles of attack, plates under gas flow, structures under follower forces, and propellant lines conveying pulsating fluid.

ABSTRACT: (U) The macromolecular self-association of ADP-ribosyltransferase protein in solution was studied by several experimental techniques: quantitative gel filtration, electrophoretic analyses in non-denaturing gels, and cross-linking the enzyme protein with glutaraldehyde, dimethyl pimelimidate, dimethyl suberimide, dimethyl 3,3'-dithiobispropionimidate and tetranitromethane. The self-association of the polypeptide components obtained by plasmin digestion was also determined by using the above cross-linking agents. Monomers and cross-linked dimers of the enzyme protein, possessing enzymic activity, were separated in non-denaturing gels by electrophoresis. The basic polypeptide fragments, exhibiting molecular masses of 29 kDa and 36 kDa, self-associated, whereas the polypeptides with molecular masses of 56 kDa and 42 kDa associated only to a negligible extent, indicating that the peptide regions that also bind DNA and histones are probable sites of self-association in the intact enzyme molecule. Macromolecular association of the enzyme was indicated by a protein-concentration-dependent red-shift in protein fluorescence. The specific enzymic activity of the isolated ADP-ribosyltransferase depended on the concentration of the enzyme protein, and at 2.00 micrometers concentration the enzyme was self-inhibitory. Dilution of the enzyme protein to 20-40nM resulted in a large increase in its specific activity. Further dilution

UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Prepared in cooperation with Stanford Univ.

ABSTRACT: (U) The Report presents the research (including relevant publications) undertaken at Purdue University and, under subcontract, at Imperial College, London, on analytical-computational and experimental studies on the determination of the influence of inhomogeneous and isotropic turbulence on boundary layers, including cases with heat transfer. The modelling of the influence of Free Stream Turbulence on boundary layer turbulence (BLT) has been based on the so-called large eddy interaction hypothesis, wherein the interaction between a representative large eddy and all of the eddies is related to a skewness factor and a damping factor. The boundary layer is divided into four asymptotically matched regions, including the free stream, and the flowfield is calculated based on the necessary (as proved herein) assumption of the existence of a logarithmic law region adjoining the wall viscous region. A detailed comparison between the experimental data Hancock and Bradshaw and the predictions obtained for the same case of interaction between FST and BLT is a fully-developed TBL is presented and provides substantial credibility to

the method of approach. The experimental work at Imperial College has been devoted to a study of the effects of anisotropic FST on heat transfer in low speed TBL. (kr)

UNCLASSIFIED REPORT

ABSTRACT: (U) A two-phase task was undertaken to the Probabilistic Fracture Analysis Code (PROFRANC) developed under this project. Phase one consisted in predicting deterministically the outcome of a subset of a larger number of experiments in which variability in geometry and material parameters was purposely minimized. The purpose of this phase was to verify that PROFRANC could predict nearly deterministic events accurately. This phase was shown to be highly successful. This verification was based on experimental results which had to be obtained within this project due to a paucity of comprehensive mixed-mode fracture propagation data in the open literature. In Phase two all currently available data involving inherent uncertainties in some material and geometrical parameters was assembled in a probabilistic framework and subsequently compared to the probabilistic predictions of PROFRANC qualitatively and quantitatively. These comparisons were shown to be very successful. The quantitative comparison was performed by hypothesis testing, which is a mathematical rule deciding whether to accept or reject PROFRANC predictions using experimental data. (kr)

UNCLASSIFIED REPORT

ABSTRACT: (U) This program covered microscopic theory of optical nonlinearity, design and synthesis of novel structures, materials processing for guided waves, measurements of optical nonlinearities and study of device processes. Both classical anharmonic oscillator approach as well as ab-initio calculations to understand the microscopic nature of optical nonlinearities in organic structures had been described. The ultimate goal is to understand the structure-property relationship so that one may be able to predict structures with enhanced optical nonlinearities. The focus of our work has been on third-order optical nonlinearity. We developed a simple model of coupled locally anharmonic oscillators which can be used to describe the optical nonlinearities in conjugated organic monomeric, oligomeric and polymeric structures. We showed that the method can very readily be used to explain the dependence of the band gap, the polarizability, alpha, and the second hyperpolarizability, gamma, as a function of the number of repeat units for the oligomers of thiophene and benzen. The results predicted by the coupled anharmonic oscillator model are in good agreement with those of the experimental studies of thiophene and benzene oligomers recently reported by our group. In addition, the predicted power dependences of orientationally averaged (alpha) and (gamma) on the

number of repeat units were compared with those predicted by a free electron model, PPP methods, sum-over-states method and ab initio calculations. (TTL)

UNCLASSIFIED REPORT

ABSTRACT: (U) The general goal of the work has been to develop the techniques needed to process queries, expressed as logic programs, efficiently. A system called NAIL was developed, by mid-1989, to test out our ideas. It was fully declarative, which we found an interesting challenge, and its implementation exposed a number of issues that lead to important new ideas and research. However, the full declarativeness proved too much of a burden in writing some applications that we hoped would be facilitated by a logic/database language, and NAIL was abandoned in favor of a new language, called GLUE, that is logical, but that allows for controlled-flow, sets as data values, aggregation operators such as sums of average. NAIL now serves as the view facility for GLUE, and we are in the process of writing a NAIL-to-GLUE translator that will offer both nondeclarative capabilities of GLUE and the declarative capabilities of NAIL, whichever is more appropriate in a given situation. ABSTRACT: (U) The purchase was made of a complete Nd:YAG pumped picosecond dye laser and related optical components. Matching support was provided for an autocorrelator, power meters, lock-in detectors and Optical Table to form a complete measurement system. The idea was to fabricate a picosecond system which would measure devices and systems out to at least 200 GHz. It would be used to validate Network analyzer measurements in the region of overlap and to develop a degree of confidence in the entire technique of S parameter measurement using picosecond pulses. The highest frequency GaAs and GaAs alloy devices were investigated. New types of devices, MMIC amplifiers and finally the operational constraints of optical interconnections were studied. The system proved to be so useful that we actually performed to be so useful that we actually performed all of these tests and have extended these measurements to the generation of millimeter radiation and the demonstration of spectroscopic use. Current measurements are on ballistic field effect devices and resonant tunneling structures which have been fabricated by local industries and universities directly as a result of this unique measurement capability. ABSTRACT: (U) This research project is aimed at developing silicon based implementations of neural network models. The main advantages of our approach are its use of standard, present day technology and its highly memory due to the use of optics. Two different embodiments of the electronic part of the neural processor have been realized. A phototransistor based network using standard complementary metal oxide semiconductor technology has been built and tested. The CCD version of the optoelectronic architecture has been fabricated and tested, proving the viability of this architecture. All electronic loading has been explored and offers possibilities of rugged, compact systems. (KR)

ABSTRACT: (U) It is now generally accepted that not all faults in VLSI logic can be represented by the stuck-at-0 and stuck-at-1 models used at the gate level. In order to ensure realistic modeling, faults should be considered at the transistor level, since only at the level the complete circuit structure is known. In other words, test for circuits should be derived based on possible 'shorts' and 'opens' at the transistor level. A stuck-open or stuck-closed transistor can be modeled by replacing the faulty transistor with an open connection or a direct short respectively between the transistor's source and drain. (rh)

## UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Pub. in Physics of Space Plasmas, SPI Conference Proceedings and Reprint Series, n9 p31-68 1989.

ABSTRACT: (U) Low frequency electromagnetic turbulence is proving to be an important source of energy for the acceleration of ions in various regions of the Earth's magnetosphere. In particular it has been shown to account for some of the energetic oxygen conics found in the auroral regions, and a convincing case is being built for its role in the cusp/cleft region of the magnetosphere. The transfer of energy from the waves to the particles is efficiently accomplished through ion cyclotron resonance with the left-hand polarized component of the turbulence, and the result of the interaction is a heating of the particle distribution. In this tutorial review, we shall present a general theoretical treatment of ion cyclotron resonance heating in a weakly inhomogeneous magnetic geometry and then proceed to examine the formation of auroral ion conics in somewhat greater detail. For the auroral case, the properties of the electric field spectral density and the Earth's dipolar magnetic field allow the introduction of a similarity transformation which results in a considerable simplification of the analysis for the altitude asymptotic form of the conic distribution. The merit of this approach is that it makes it possible to directly compare the theory with observations, and the agreement is found to be excellent.

ABSTRACT: (U) This reprint examines the effects of the relationship between cirrus cloud ice water content and cloud temperature on climate change. A simple mechanistic climate model is used to study the feedback between ice water content and temperature. The central question studied in this paper concerns the extent to which both the radiative and microphysical properties of cirrus cloud influence such a feedback. To address this question, a parameterization of the albedo and emissivity of clouds is introduced. Observations that relate the ice water content to cloud temperature are incorporated in the parameterization to introduce a temperature dependence to both albedo and emittance. The cloud properties relevant to the cloud feedback are expressed as functions of particles size  $r$ , sub  $e$ , asymmetry parameter  $g$  and cloud temperature and analyses of aircraft measurements, lidar and ground based radiometer data are used to select  $r$ , sub  $e$  and  $g$ . It was shown that scattering calculations assuming spherical particles with a distribution described by  $r$ , sub  $e$  = 16 microns reasonably matched the lidar and radiometer data. However, comparison of cloud radiation properties measured from aircraft to those

parameterized in this study required values of  $g$  significantly smaller than those derived for spheres but consistent with our understanding of non-spherical particle scattering. Keywords: Cloud microphysics; Radiative transfer. (kr)

ABSTRACT: (U) The research findings of the AFOSR Grant AFOSR-86-0196, Optical Symbolic Computing Tasks are summarized. The grant period was 1 June 1986 - 29 November 1989. Specifically, we have concentrated on the following topics: complexity studies for optical neural and digital systems, architecture and models for optical computing, learning algorithms for neural networks and applications of neural networks for early vision problems such as image restoration, texture segmentation, computation of optical flow and stereo. A number of conference and journal papers reporting the research findings have been published. A list of publications and presentation is given at the end of the report along with a set or reprints. ABSTRACT: (U) New instruments have been installed at observatories in New Mexico and California for measuring solar magnetic fields and surface velocities. The magnetic fields provide the energy for all eruptive and accelerative processes on the Sun, and the surface velocities reveal the dynamics of the solar interior. Early detection of emerging magnetic fields may give several hours' warning of impending solar flares and interplanetary shocks. The new instruments incorporate several technical innovations, including lithium niobate filter for high spectral resolution. With this filter, circular and linear polarization and Doppler shifts are measured in solar spectral lines to yield estimates of the magnetic field vector in active sunspot regions. A program of daily measurements is planned for study of the current peak in the 11-year solar cycle. Keywords: Sunspots, Solar magnetic fields, Surface velocities. (JHD)

ABSTRACT: (U) The excitation of Langmuir waves by a gentle bump-on-tail has become the classic example for a kinetic instability. Most turbulence theories, ranging from quasi-linear theory to strong turbulence, have also been developed starting from this model. We discuss the practical application and the extension of these theories to recent observations of electron beam-plasma interactions. Observations in the electron foreshock, in particular, show that linear instability theory must be extended to also describe the excitation of waves with frequencies substantially different from the plasma frequency. New questions about turbulence theories are then raised. The departure point for any extensions should be a quantitative test of existing theories, starting from linear instability theory for the actual non-Maxwellian distribution functions and other features predicted by quasi-linear theory. Particle simulations allowing for such tests are described. It is the unique advantage of simulation studies that more physics can be added step by step. This procedure is used to differentiate between various nonlinear turbulence effects. Reprints. (JHD)

ABSTRACT: (U) Ion conic distributions are often observed in the cusp/cleft region of the dayside magnetosphere. We show that these ions can be heated by resonant interactions with broadband low-frequency (near the ion gyrofrequency) waves. Data from one cusp/cleft crossing of the polar orbiting DE-1 satellite is studied in detail. Observed cool O+ distributions and observed wave intensities are used as input to a Monte Carlo simulations. The theoretically obtained hot O+ distributions are in good agreement with the corresponding observed distributions. This resonant heating by broadband low-frequency waves is important for the outflow of ionospheric ions into the magnetosphere. Reprints. (JHD)

ABSTRACT: (U) The generation of waves with frequencies downshifted from the plasma frequency, as observed in the electron foreshock, is analyzed by particle simulation. Wave excitation differs fundamentally from the familiar excitation of the plasma eigenmodes by a gentle bump-on-tail electrons distribution. Beam modes are destabilized by resonant interaction with bulk electrons, provided the beam velocity spread is very small. These modes are stabilized, starting with the higher frequencies, as the beam is broadened and slowed down by the interaction with the wave spectrum. Initially, a very cold beam is also capable of exciting frequencies considerably above the plasma frequency, but such oscillations are quickly stabilized. Low-frequency modes persist for a long time, until the bump in the electron distribution is completely 'ironed' out. This diffusion process also is quite different from the familiar case of well-separated beam and bulk electrons. A quantitative analysis of these processes is carried out. Keywords: Reprints; Plasma waves; Electron foreshock; Simulation; Downshifted oscillations; Diffusion; Electron beam. (UHD)

SUPPLEMENTARY NOTE: Pub. in Jnl. of Geophysical Research,  
v95 nA6 p8095-8110, 1 Jun 90.

ABSTRACT: (U) The generation of Langmuir waves by a gentle bump-on-tail electron distribution is analyzed. It is shown that with appropriately designed simulation experiments, quasi-linear theory can be quantitatively verified for parameters corresponding to the electron foreshock. The distribution function developed a plateau by resonant diffusion, and changes outside this velocity range are negligible, except for the contribution of nonresonant diffusion to acceleration of bulk electrons. The dispersions relation is solved for the evolving distribution function and exhibits the dynamics of wave growth and changes in real frequency. The integral of the quasi-linear equations is also used to relate the evolution of distribution function and wave spectrum and gives agreement with the simulations. Even in extremely long simulation runs there is practically no evolution in wave energy or the distribution function once a plateau has been formed. The saturated field levels are much lower than the estimates that are generally used to assess the importance of additional weak or strong turbulence effects. These effects cannot prevent plateau formation and are only noticeable if ions are also included in the model. They then lead to a redistribution of the spectrum toward low wave numbers modes which

AD-A228 765

AD-A228 765 CONTINUED

propagate mainly opposite to the beam. This occurs long after plateau formation and play no significant role in the overall system dynamics or energy balance. One will have to live with quasi-linear theory as a key ingredient for a global model of foreshock wave phenomena. Reprints. (JHD)

ABSTRACT: (U) Broadband turbulence in the lower-hybrid to plasma frequency range is found in a variety of forms in the supraauroral region, most notably as auroral hiss and VLF saucers. When the turbulence is intense, it is observed to be associated with ion conics (ions heated transverse to the geomagnetic field) and counter-streaming electron fluxes (heated in both directions parallel to the field). This tutorial will begin with a review of the dispersion and propagation characteristics of whistler resonance-cone waves, which comprise the turbulence, and go on to discuss the theories for the excitation of the turbulence. Plasma simulation and mesoscale (Monte Carlo) simulation techniques will be used to illustrate the interaction of the ambient plasma with the turbulence. These calculations will demonstrate how this interaction results in transverse heating of the ions and parallel heating of the electrons of the plasma, leading to the formation of the observed heated and accelerated particle fluxes. Keywords: Lower hybrid waves, VLF waves, Ion conics, Strong turbulence. Reprints. (JHD)

ABSTRACT: (U) Numerical simulation is used to study mixing of a passive scalar in a spatially-developing shear layer at high Reynolds number. The numerical method is based on discretization of the vorticity and scalar gradients into finite-area elements and the transport of these elements along particle trajectories. Results show that mixing is governed by the entrainment of fluid from both streams into the large structures generated by the rollup of the vorticity layer. Local value of scalar concentration oscillates, due to the passage of these structures, between values limited by the Peclet number. Instantaneous scalar profiles exhibit mixing asymmetry and the skewness of concentration fraction within the eddies in favor of the high-speed stream. Mixing statistics of a passive scalar agree well with the experimental measurements of Masutani and Bowman in a two-dimensional shear layer, and emphasize the effect of molecular diffusion on mixing. The rate of burning in a single step Arrhenius chemical reactions between the two streams increases due to mixing enhancement, overcoming the decrease due to the strain field generated by rollup. Local product concentration is everywhere proportional to the vorticity, suggesting a new formula for turbulent combustion modeling. (Author) (KR)

ABSTRACT: (U) The electron beam-plasma instability is analyzed in particle simulation experiments, starting with a beam of small velocity spread. The dispersion relation is solved for snapshots of the actual evolving electron distribution function, rather than for the usual models consisting of Maxwellians. As the beam broadens, the analysis shows a transition from reactive beam modes, with frequencies extending much below the plasma frequency  $\omega_{pe}$  to kinetic instability of Langmuir waves,  $\omega \approx \omega_{pe}$ , which is in agreement with the frequencies and growth rates observed in the simulation. Beam evaluation is also in agreement with quasi-linear theory, except at the end of the reactive phase when trapping of beam electrons is seen. Although the spectrum temporarily narrows at this stage, there are, in contrast to previous simulations, still many modes present. The system then can proceed to a kinetic phase in which quasi-linear theory is again applicable. This stage is identical with the evolution starting from a gentle broad beam, except that wave levels are several times higher. With higher wave levels, mode coupling effects are also more prominent, but are still unable to prevent plateau formation. In contrast to the Langmuir wave regime, the reactive broadband wave regime lasts

ABSTRACT: (U) Low frequency turbulence present on closed field lines in the central plasma sheet has been used to explain ion heating and conic formation with remarkable success. However, the source for the turbulence has yet to be established, and there are no obvious local sources which could power such a broadband spectrum. Alternatively, observations reveal that ion distributions in the equatorial region are often anisotropic, and such distributions excite waves both above and below the proton gyrofrequency. As these waves propagate to lower altitudes where the magnetic field is stronger, their left-hand circularly polarized component resonates with heavy ions. The presence of a parallel gradient in the magnetic field complicates the details of wave propagation, and as a result, downcoming right-hand circularly polarized waves, which acquire a left hand circularly polarized component at the crossover frequency, may tunnel through 'stop zone' to altitudes where they resonant with the ions and thus contribute to the observed ion heating. ABSTRACT: (U) The regulation of synaptic reactivity by protein kinase C and its substrates has been studied using the long-term potentiation paradigm (LTP). We have studied the effects of protein kinase C activators and inhibitors on the durability of synaptic reactivity. The main conclusion to be drawn is that PKC is necessary but not sufficient for the enhanced durability. In combination with a neural signal, however, PKC demonstrates a profound synergism. Synergism is also observed in the analysis of metal ion regulation of PKC activity. Calcium and zinc interact in their effect on the enzyme in a bidirectional manner. Significant accomplishments made during this period were: determining the effect of inhibitors; the study of PKC activators (PDBu and oleate); metal ion regulation of PKC activity; and a second path for PKC activation. Keywords: Synaptic reactivity, Protein kinase, Activators, Inhibitors, Synergism. (js)

ABSTRACT: (U) Research workers in many countries and in many different research areas have gradually come to realize that ledges play a central role in the growth of crystals from the vapor, liquid and solid phases. However, the structure of ledges is not easy to study experimentally or to analyze theoretically. Similarly, the kinetics of ledgewise growth pose substantial problems to the experimentalist intent on their measurement and to the theoretician studies attempting to account for these data mathematically. Both experimental and theoretical studies during the three major types of phase transformation enumerated have tended to develop more or less independently of each other. The observation of ledges with TEM and field ion microscopy was discussed with emphasizing methods of distinguishing between ledges and dislocations. One speaker made clear the theoretical as well as the experimental problems involved in making this distinction by referring to certain linear defects displayed in his slides as things! This issue has greatly worried us in our recent AFOSR-sponsored research, and it was somewhat of a relief to find that this concern is shared by the best of the experts in the field. However, it is now clear that special efforts must be expended upon making this very important distinction--particularly when the ledges are only a few atomic layers high. (JHD)

ABSTRACT: (U) A variety of atomic processes contribute to absorption of radiation in dense plasmas. Most existing atomic data are for low density, high temperature plasmas. At high densities and low temperatures, realistic modeling to incorporate the important additional effects in order to generate atomic data is needed. This is addressed in the present work. The models and computer codes developed for the project includes effects of non-linear screening, electron degeneracy, exchange-correlation and ion interactions self-consistently. These were applied to ions of specific configurations in dense plasmas and represent improvements over 'average atom models' often used in dense plasma physics. The focus of this work is mainly on the bound-bound, bound-free and free-free photoprocesses, the contribute to radiation absorption and opacity of dense, low temperature plasmas. We discuss a model to generate ionic distribution that is computationally faster than rate equation method. We also discuss a model to investigate the d.c. electron conduction in dense plasmas, which incorporates effects of multiple scattering and improves over the Ziman type model. These self-consistent models and computer codes are very useful tools to generate large data bases for atomic processes

ABSTRACT: (U) Renormalization group methods (RNG) have been applied to large eddy simulations of wall regions of channel flows and spectral element RNG simulations of flows in complex geometries were explored. The results predicted wall region streaks accurately at much less spatial resolution than earlier methods. The methods were extended to compressible flows. They have been used to show that the shock region is characterized by large negative values of the divergence indicating tube-like structures. High enstrophy regions reside outside the shock regions. High vorticity regions in incompressible flow tend to be concentrated in tubes, while in compressible flows they tend to be concentrated in sheets. RNG was also applied to k-e modelling of the flow over a backward step. Full simulations were also completed for large Reynolds number turbulence. Keywords: Turbulence, Simulation renormalization group. (JHD)

ABSTRACT: (U) New polyurethanes were prepared which exhibit non-linear optical activity. The polymers were poled during synthesis, advantage being taken of the fast polymerization kinetics. Second harmonic generation (SHG) was observed from these polymers. In selected cases, no decrease in the SHF signal (due to depolarization) was observed at room temperature for up to one month. The SHG activity of a series of organic model compounds was also investigated. Keywords: Optical polymers; Polyurethanes; Harmonic generation. (JS)

## UNCLASSIFIED REPORT

ABSTRACT: (U) One of the most important computer architecture innovations to appear in the market place during the last ten years is parallel processing on a shared memory multicomputer. This report presents new algorithms for a variety of network models along with empirical analysis on both sequential and parallel computers. An empirical study on the AT and T KORB system is also presented. This system uses eight processors each of which has vector capability. Our research program objective is to develop and empirically test new parallel algorithms and software for a wide variety of optimization problems. The problems studied this past year include the shortest path problem, the assignment problem, the semi-assignment problem, the transportation problem, and the generalized network problem. Algorithms for all of these models have been developed and empirically tested on a variety of computers. In addition, we worked with the Military Airlift Command to test the AT&T KORB system located at Scott Air Force Base. (kr)

ABSTRACT: (U) Research carried out on several interrelated topics is described. These projects are all in the area of visual cognition, and focus on feature and object perception, models of selective attention, and the nature of visual routines such as curve tracing and subitizing. The major thrust of this endeavor has been to explore the nature of visual processes to determine the extent to which they are carried out in parallel or in series. Keywords: Reports/abstracts; Attention /visual perception; Information processing; Vision/cognition; Visual search; Curve tracing. (edc)

ABSTRACT: (U) Fisher 344 males rats have a dose and time-dependent renal proximal tubular degeneration induced by certain hydrocarbon compounds. We have used rat strain variation of the alpha-2U globulin molecule and metabolic alteration of the urinary pH as methods to investigate the hydrocarbon-induced nephrotoxic response. Three significant advances have been made during this project: (1) the development of a histochemical procedure to specifically evaluate decalin-induced changes in the lysosomes of rat renal tubular epithelial cells, (2) the discovery that pigmented male rats demonstrate hydrocarbon-induced nephrotoxicity, and (3) the discovery of a difference in the hydrocarbon-induced nephrotoxicity response of male rats following alteration of the urinary pH. Sodium bicarbonate-induced elevation of the urinary pH markedly altered the lysosomal integrity and morphologic appearance of renal tubular cells in male rats exposed to decalin. (JS)

ABSTRACT: (U) The effects of transverse strain on an initially two-dimensional turbulent boundary layer are studied in a direct numerical simulation of a planar channel flow with impulsively started transverse pressure gradient. Consistent with experiments in three-dimensional boundary layers, the simulation shows a decrease in the Reynolds shear stress with increasing transverse strain. Also, the directions of the Reynolds shear stress vector and the mean velocity gradient vector were found to differ. In addition, the simulation shows a drop in the turbulent kinetic energy. Terms in the Reynolds stress transport equations were computed. The balances indicate that the decrease in turbulent kinetic energy is a result of a decrease in turbulence production, along with an increase in turbulent dissipation. The effects of the transverse pressure gradient on the instantaneous flow structures were investigated. (jd)

UNCLASSIFIED REPORT

ABSTRACT: (U) A computational procedure is presented for the nonlinear dynamic analysis of unsymmetric structures on vector multiprocessor systems. The procedure is based on novel hierarchical partitioning strategy in which the response of the unsymmetric structure at any time instant is approximated by a linear combination of symmetric and antisymmetric response vectors, each obtained by using only a fraction of the degrees of freedom of the original finite element model. The three key elements of the procedure which result in a high degree of concurrency throughout the solution process are (1) mixed (or primitive variable) formulation with independent shape functions for the different fields; (2) operator splitting or restructuring of the discrete equations at each time step to delineate the symmetric and antisymmetric vectors constituting the response; and (3) two-level iterative process for generating the response of the structure. An assessment is made of the effectiveness of the procedure on the CRAY X-MP/4 computers. Keywords: Parallel processing, Symmetry transformations, Operator splitting, Mixed formulations, Iterative. UNCLASSIFIED REPORT

ABSTRACT: (U) Accurate characterization of high-speed electronic circuitry requires the introduction of optical sampling as a method of generating and measuring large electrical bandwidths. The optical sampling techniques that can be employed for measuring the electrical response of a circuit consist of electro-optic sampling 1, 2 and photoconductive switching 3, 4. In electro-optic sampling, the fields of a propagating electrical pulse induce a transient birefringence in an electro-optic crystal which, in turn, rotates the polarization of an optical probe pulse transmitted through the crystal. The time resolution of the polarization rotation is an indirect measurement of the time evolution of the propagating pulse as it passes the crystal. In addition, the crystal can be dipped into the fringing fields of the propagating electrical pulse above the circuit substrate, allowing for high spatial resolution while remaining noncontacting. In photoconductive switching, a small gap between two biased, transmission line conductors laid down on a semiconducting substrate can be electrically closed by an optical pulse focused onto the gap. This results in the generation of an electrical pulse whose shape and duration are determined by the laser pulsewidth, the circuit characteristics of the gap and transmission line and the photo-excited carrier lifetime of the substrate. UNCLASSIFIED REPORT

ABSTRACT: (U) Electrophoretic deposition of ceramic particles on porous graphite and their penetration into the pores was demonstrated and studied both theoretically and experimentally/ The theoretical analysis enables to predict the penetration depth of the particles as function of two non-dimensional parameters based on solvent properties, field strength and particle size and concentration. In the experimental studies the amount of induced material was found to increase with the ratio of dielectric constant to viscosity of the solvent, as well as with particle concentration and field intensity. However, due to simultaneous buildup of an overlying deposit penetration as function of deposition time reaches a plateau. In parallel studies on electrolytic deposition, ZrO2 coatings were deposited on porous graphite from an aqueous solution of ZrO(NO3)2. The deposition kinetics and microstructure of the deposit were studied. The initial amorphous deposits transformed into crystalline ZrO2 polymorphs with nanocrystalline dimensions following heat treatment. (RRH)

UNCLASSIFIED REPORT

ABSTRACT: (U) The principal portion of this Final Report on the present grant, Artificial Intelligence Methods in Pursuit Evasion Differential Games, consists of an attached Technical Report by Rodin and Weil, on Differential Games and Artificial Intelligence in Air Combat. The rest of the report is a brief summary of our activities and achievements under the grant during the past three years. The summary is brief, because it is merely a restatement of reports sent by the P.I. to the AFOSR regularly during the life of the grant. The air of the research here proposed is to develop the conceptual framework and the software for the prototype of an operational, on-board, real time multiprocessing computer system, capable of assisting the pilot in flight and fire control decisions; in other words, a Tactical Decision Aiding Expert System (TDAES). The end product of this research will be for use in theoretical combat planning and analysis; in practical fighter pilot training (e.g., in simulations); and as an actual aid for pilots in support of their tactical decision making diurnal flights. The nature of this research is intelligent control of a very specific type; we intend to combine certain aspects of differential game theory, 3 dimensional computational geometry and artificial intelligence in a unique way, so as to provide a solution to the problem described above.

ABSTRACT: (U) The aerodynamic properties of an airfoil under unsteady conditions are very different from ones in steady conditions because the vortex generated by unsteady separation greatly modifies the loading on the wing. In this study, a fundamental approach was taken to investigate the lift and the velocity field of unsteady airfoils. Keywords: Airfoil unsteady water channels, Delta wings, Lift, Flow visualization. (Author) (KR)

ABSTRACT: (U) The aim of the proposed research effort involved theoretical work, both analytic and numerical, on a number of different problems which were all loosely tied together as involving some aspect of vortex systems, and their relation to chaos in fluid flows. Significant results were obtained during this funding period in several major topics. The first topic which was investigated was a continuation of the author's previous work on vortex lattices. Results consisted of the refinement of the analytic expression for the lattice summation of an infinite lattice of point vortices, and use of this expression to calculate the allowed lattice structures of two-component triangular lattice. It was also shown how these expressions can be used to calculate the bulk physical properties of vortex lattices, by calculating the energy of slip displacement for the triangular lattice. (Jhd)

ABSTRACT: (U) Investigation concerns the 3D stresses in a laminated composite plate weakened by a circular hole. The analysis is based on 3D macromechanical considerations. The debonding aspects are investigated between a fiber/matrix interface particularly in the region where the fiber intersects a free edge, e.g., the surface of a hole. The results, which are based on micromechanical considerations, are then used to predict the critical applied load stress which may cause initiation of ply-delamination. Keywords: Composite plates; Laminates. (RH)

ABSTRACT: (U) A unified approximation framework for parameter estimation in general linear partial differential equations models has been completed. This framework has provided the theoretical basis for a number of identification problems on which these investigators have made significant progress. These include: (i) nondestructive evaluation techniques of composite materials using thermal probes, (ii) estimation of damping in composite material beams from vibration experiments. In connection with item (ii) it has been shown conclusively that an identification of damping mechanisms in the partial differential equation of a composite beam cannot be accomplished by the use of experimental model analysis. This is a major result in the theory of identifying damping mechanisms in flexible structures. The group has also studied questions related to the determination of irregularities (corrosion, cracks, delaminations, etc.) in composite materials using boundary observations of temperatures after known heat fluxes have been applied to the boundary. Successful efforts using experimental data with the theoretical and computational ideas developed by this group are reported. Substantial progress has been made on the development of a statistical framework (including hypothesis testing algorithms) to use in comparing the suitability of PDE models in least squares fits to data. A number of results on feedback stabilization of distributed parameter model

UNCLASSIFIED REPORT

ABSTRACT: (U) Flow within the thrust chamber of an MPD arcjet is examined experimentally and modeled with a two-dimensional MHD code. Two quasi-steady MPD thrusters are considered under the same input conditions of current (21 kA) and total mass flow rate (0.008 kg/s, argon + 1.5% hydrogen). The arcjets have the same basic design, consisting of a central cathode, 3.8 cm diameter and 5 cm long, separated from a coaxial anode of equal length by a uniform gap of 2.3 cm. Two different mass injection arrangements are used (100% at mid-radius, and 50% at the cathode base, with the remainder at mid-radius). A new spectroscopic analysis procedure is developed that allows distributions of radial speed, heavy-particle temperature and turbulent speed to be extracted from chordal measurements of light emission by the two species in the plasma flow. Good qualitative (and reasonable quantitative) agreement exists with distributions calculated by the MHD code, indicating that flow within the thrust chamber expands from an electromagnetically-pumped plasma base (vs a pumped jet off the cathode tip). The significant variation of internal flow dynamics with mass injector arrangement implies the need for extensive experimentally-validated code modeling in order to evaluate the potential performance of MPD thrusters. (RRH)

UNCLASSIFIED REPORT

ABSTRACT: (U) Preliminary results are presented for set estimation of uncertain nonlinear systems. Set estimation is a process in an adaptive robust control system which produces a set of models from the measured data. The set is then used in an on-line robust control design to implement a controller which is guaranteed to achieve performance goals for all members on the set. The scheme works whenever the actual system which produced the data is a member of the estimated set. The results of this report extend some previous work in linear set estimation to nonlinear systems. This report also summarizes an analysis of an adaptive nonlinear system using the method of averaging. The aim of adaptive control is to implement in real-time and on-line as many as possible of the design functions now performed off-line by the control engineer. Although it is easy to configure an adaptive system by connecting an estimator and control design rule, research is essential to identify the performance limitations of adaptive strategies for LSS control. The long range goal of this research program is to establish guidelines for selecting the appropriate strategy, to evaluate performance improvements over fixed-gain mechanizations, and to examine the architecture necessary to produce a practical hardware realization. The initial and continuing thrust, however, is to build a strong

ABSTRACT: (U) This report documents the research performed for the Large Space Manipulator Study contract. The derivation of nonlinear dynamic models for a simple 3-D articulated, elastic structure is discussed. Kane's dynamics equations are used to obtain equations of motion is closed form; the bending deformations of the elastic links, modelled as slender elastic beams, are described with the assumed-modes method. A 2-D planar version of the dynamic model is used to predict the dynamic behavior of an experimental, articulated two-link elastic structure. Both links consist of thin elastic beams with rectangular cross section. The outer link has a tip payload of variable mass and moment of inertia. The structure is instrumented with position/rate/acceleration/sensors mounted at the articulations and at the end-point; strain-gauges are mounted along the links at several locations. Close agreement between the analytical predictions and the experimental measurements is documented for modal tests and for slow maneuvers of the structure. The design and implementation of several digital compensators to actively control the single elastic beam as well as the 2-DOF elastic structure are presented. The compensators are obtained using classical design techniques and the Linear Quadratic Gaussian/Loop Transfer Recovery (LQG/LTR) method. (kr)

ABSTRACT: (U) The goal of primary interest in these investigations was the development of novel methods for filling elastomeric networks. The techniques developed employ the in-situ generation of reinforcing fillers such as silica or a glassy polymer such as polystyrene either after, during, or before network formation. The reaction involves decomposition of organometallic compounds, using a variety of catalysts and precipitation conditions, or free-radical polymerization of a suitable monomer. The effectiveness of the technique is gauged by stress-strain measurements carried out on these elastomeric composites to yield values of the maximum extensibility, ultimate strength, and energy of rupture. Also of interest are calorimetric studies of the networks, to determine their crystallizability. Information on the filler particles themselves is obtained from density determinations, electron microscopy, and scattering measurements. (RH)

UNCLASSIFIED REPORT

ABSTRACT: (U) Theoretical analyses were performed on several different types of diffusion flames to study the flame radiation effect. In the first problem, a soot formation and oxidation scheme was incorporated into a turbulent diffusion flame model adjacent to a solid fuel. The computed results for the natural convective fire showed good agreement with experimentally measured solid fuel burning rate. Soot radiation increased its importance with flame height. With flames greater than 1 meter, the radiative heat flux exceeded that by convection. In the second problem, matched asymptotic expansions were employed to study the spherical diffusion flame around a droplet or solid particle with flame radiation. It was found that the importance of radiation increased with droplet radius. The theory predicted that there was a maximum droplet or particle size above which a spherical flame could not be supported due to radiative loss. In the third problem, the thermophoretic motion of small particles (e.g., soot) were studied in a stagnation-point laminar flow next to a heated plate with and without combustion. It was found that both the thermophoretic motion and this Brownian particle diffusion can have a profound effect on the particle concentration distributions. (js)

**ABSTRACT:** (U) In high-speed flows, laser-induced fluorescence (LIF) on Doppler-shifted transitions is an attractive technique for velocity measurement. LIF velocimetry has been applied to combined single-point measurements of velocity, temperature, and pressure and two dimensional imaging of velocity and pressure. Prior to recent research using NO, LIF velocimetry in combustion related flows relied largely on the use of seed molecules. In this letter we report simultaneous, single-point LIF measurements of velocity, temperature, and pressure using the naturally occurring combustion species OH. This experiment is an extension of earlier research in which a modified ring dye laser was used to make time resolved temperature measurements behind reflected shock waves by using OH LIF. A pair of fused-silica postflame gases by using OH LIF. A pair of fused-silica rhombs mounted on a single galvanometer in an intracavity-doubled Spectra-Physics 380 ring laser permit the UV output to be swept continuously over a few wave numbers at an effective frequency of 3kHz. ABSTRACT: (U) Polarization radar observations provide  
information on characteristics of precipitation particles  
not available with conventional weather radar.  
Observations are reported for four parameters made with  
the 25m Chilbolton dish the largest steerable  
meteorological radar in the world. These are the first S-  
band measurements of the linear depolarisation ratio and  
the most accurate co- copolar correlations yet reported.  
Ten publications describe the work in more detail. This  
report demonstrates how the new parameters can be used to:  
differentiate ice from water, differentiate the different  
forms of ice (snow, hail pellets), locate areas where  
large hail is forming, and identify clouds posing a  
threat of triggered lightning before natural lightning or  
breakdown has occurred. Keywords: Polarization radar, Ice,  
Hail, Raindrops, Bright band, Lightning, Great Britain.

UNCLASSIFIED REPORT

ABSTRACT: (U) Turbularization of an acoustic boundary-layer (Stokes layer) on impermeable and permeable surfaces is analytically considered. The theoretical approach utilizes a second-order closure model of turbulence. An approximate, closed form solution and a more comprehensive finite difference solution of the time dependent, parabolic, one dimensional governing equations are obtained. For simple acoustic boundary layers on impermeable surfaces, the approximate solution and the numerical results for the critical acoustic Mach number required for turbulent transition are qualitatively confirmed. Calculations for acoustic boundary-layers with transpiration (injection) indicate a substantial reduction for the acoustic Mach number required for transition, up to a frequency dependent limiting injection velocity. The results may provide a practical mechanism for flow related combustion instability in solid propellant rockets, since turbularization of near surface combustion zone could result in relatively low acoustic Mach numbers. An analysis of the transitional and turbulent reactive acoustic boundary layer on a homogenous solid propellant surface investigates

potential mechanisms of combustion instability. A new technique is developed for the condensed phase thermal layer, in which the propellant space is mapped onto the gas space and efficiently solved using the same adaptive numerical grid. An acoustic pressure node is obtained in the absence of a mean axial flow.

ABSTRACT: (U) A Hydrogen-Helium mixture was chosen to investigate the structure of a counterflow diffusion flame. Reacting and non reacting conditions were studied at the same Reynolds number. To study the reaction zone structure, high speed tomography based on Mie scattering was employed using a copper vapor laser and a Fastax high speed camera. LDV measurements were also obtained. Different seeding techniques were used to visualize both the turbulent air and fuel jets. The tomographic records were digitized and recorded in a digital computer for statistical treatment. Significant differences in the wrinkle scales between the reacting and non reacting flows were found. A fractal statistical analysis of the tomography records was done to quantify these differences. Seeding of both fuel and air jets provided a mean for the evaluation of the reaction zone thickness. The strain of the reaction zone was obtained from the time resolved tomographic records. Local flame extinction and reignition were observed for different H<sub>2</sub>/Helium fuel mixtures. Keywords: Turbulent diffusion flames, Rayleigh scattering. (js)

UNCLASSIFIED REPORT

ABSTRACT: (U) The goal of the Optical Symbolic Processor for Expert System Execution program is to develop concepts for optical computers which can perform real-time symbolic processing. The program is divided into two sections, architecture development and development of a device for reconfigurable interconnects. In the first quarter of the program, only architecture development work was performed. The approach for this phase of the program has been to examine computational models of computer languages and determine the primitive operations required. Possible optical implementations of these primitives were then examined and evaluated. In general, a top down approach was taken with the goal of a direct optical implementation of the desired primitive operations. It was found that the computational requirements of logic languages and functional languages (Section III) are primitive operations which involve manipulation of complex data structures such as graphs and trees, and that the execution of the languages can be described as manipulations of those data structures. The representation of the complex data structures imply that the representations must be exact (digital) and that some means to denote connections between data items, such as pointers, is required. Since the representation between data items is more important than the actual items stored, the most important functions involve the manipulation of

ABSTRACT: (U) An effective procedure is presented for calculating analytical derivatives of the energy in Hartree-Fock-type procedures including configuration interaction in cases where the number of configurations is small. This situation commonly arises in calculations involving semiempirical models such as MNDO or AM1. Existing numerical procedures are unsatisfactory, having been designed for ab initio applications where large numbers of configurations must be included. Reprints. (Jhd)

ABSTRACT: (U) Dissociative recombination and excitation measurements have been performed for H + 3 ions formed under a variety of source pressures and gas mixtures. At low pressures, an r.f. trap ion source results are lower than previous measurements from a conventional source by a factor of eight. Similar remeasurements are made for H + 3 formed in an rf trap source using a helium hydrogen mixture. Ions used for these measurements had an internal energy of lev. UNCLASSIFIED REPORT

ABSTRACT: (U) Flat-plate penetrometers, have become an important part of in situ testing in geotechnical engineering. However, use of flat-plate penetrometers has been highly empirical, mainly due to the lack of knowledge of soil response to the flat-plate penetration. In this project, a numerical technique capable of computing strain paths for three-dimensional penetrometers was developed. A calibration chamber system for cohesive soils and model flat-plates were fabricated. Three dimensional strain path analyses were performed for several of the flat-plate penetrometers currently being used. Results show that flat-plates can induce large strains and strain reversals at levels comparable to those of cone penetration. The characteristics of the strain field during a flat-plate penetration is influenced by both the w/t ratio and the tip apex angle. Regardless of the geometry, the pore pressure and total stress peak at the tip of the penetrometer. The pore pressure and total stress decrease sharply as the soil element passes the tip of the flat-plate. The pore pressure with the plate thickness as some had suggested. For a simple flat-plate (i.e., the flat Marchetti dilatometer), the penetration-induced pore pressure is positively related to the soil rigidity index in the

ABSTRACT: (U) Planar laser induced fluorescence imaging of nitric oxide in nonreacting shock-heated flows with vibrational nonequilibrium is reported. The images obtained provide a means to examine shock structure as well as to visualize and to measure the vibrational nonequilibrium induced by shock waves. The flows were generated within a shock tube with a test gas of 0.5% NO in nitrogen. A narrowband ArF laser tuned to excite transitions in the D from X (0,1) band of NO was used as the excitation source and the resulting broadband fluorescence was collected at 90 deg. using an intensified, 2-D photodiode array camera. Images presented include a normal incident shock; a normal reflected shock; a shock reflected from a nonplanar endwall; and a detached oblique shock formed in supersonic flow over a 2-D wedge. The vibrational relaxation imaged behind the normal incident and reflected shocks was analyzed and compared with calculations based upon relaxation data previously reported. Keywords: Laser, Fluorescence, Imaging, Shock tube, Nonequilibrium, Nitric oxide, Reprints. (jhd)

ABSTRACT: (U) Laser produced plasmas are now commonly used as atomic sources for thin-film deposition of low vapor pressure solids. The recent demonstration that a two-stage approach to laser ablation can lead to beam focusing and hence significant enhancement in the atomic flux suggests yet a wider range of applications which may now include basic spectroscopy on extremely low vapor pressure transition metals, normally performed with evaporable sources in conventional heat pipe ovens. Our group is now investigating the production of dense ion beams by laser resonance ionization of focused metal vapor atomic beams produced by ablation of barium and strontium. The increased ion and atomic flux densities may now permit studies of charge transfer reactions between colliding beams at volumetric rates much higher than those obtainable from collimated evaporative sources. SUPPLEMENTARY NOTE: Pub. in Review of Scientific Instruments, v61 n7 p1808-1815 Jul 90.

ABSTRACT: (U) Imaging systems based on image intensified photodiode array cameras are excellent detectors for laser induced fluorescence experiments in fluid mechanics and combustion science. The principles of operation of such a system are described. Special attention is given to the use of an image intensifier in conjunction with cw-laser experiments. In that mode, ghost images caused by the finite phosphor decay time can contribute major systematic errors. Measurements of the phosphor decay times for exposure times between 0.1 and 100 ms (a typical range for cw-laser experiments) were conducted and show that the decay time increases with exposure time. Methods for circumventing the ghosting problem are suggested. The signal and noise analysis points to analog-to-digital converter noise (ADC) or quantization error of the camera and to photon shot noise as the dominating noise sources. The image intensifier improves time resolution and signal-to-noise ratio (SNR) by moving the system from the camera noise limit to the shot-noise limit. Once the shot-noise limit is reached, the SNR can only be improved by increasing the quantum efficiency of the intensifier, not by increasing the intensifier gain. The spatial resolution of such a system is generally limited by the photodiode array, but can be dominated by

ABSTRACT: (U) Planar laser induced fluorescence of NO is used to acquire 2 D images of velocity in Mach 7.2 underexpanded jet of N<sub>2</sub> seeded with 0.5% NO. NO is excited using a pulsed excimer pumped dye laser at 226.234 nm pumping the A-X (0,0) Q1(6) line. The resultant fluorescence is imaged with an intensified 240x512 pixel solid state camera. The fluorescence is related to the velocity through the Doppler shift. A simple algorithm is used to extract velocity from the fluorescence images. The velocity data have been compared with correlations and good agreement has been found. This method for molecular velocimetry allows utilization of a laser which is spectrally broad with respect to the absorption line. Sources of error in this technique are discussed. An extension of this technique to single shot simultaneous 2 D measurements of temperature, pressure and two components of velocity is also suggested. ABSTRACT: (U) We report the results of a large-scale,  
iteration procedure to assign and fit experimental  
spectra of Argon compounds. The calculations employed a  
new multiparameter functional form for the global  
potential. The parameters were varied randomly, and  
converged vibrational energies were obtained for each  
'trial' potential. After recognizing an inverse isotope  
effect, the experimental vibrational/bending energy  
intervals are accurately reproduced for both Ar-OH and Ar-  
OD. A preliminary rotational analysis is also in  
excellent agreement with experiment. Keywords: Physical  
chemistry. (js)

ABSTRACT: (U) The XIX International Conference on  
Chronobiology was held in Bethesda, Md. on 20-24 June  
1989. Two hundred and thirteen papers were presented  
covering topics from fundamental research to applications  
of chronobiological principals to maintaining healthy  
individuals. The abstracts of the papers presented were  
published in the April-June 1989 issue of CHRONOBIOLOGIA.  
That issue constitutes the final report for this project.

ABSTRACT: (U) The general objective of this program was to explore the feasibility of synthesizing novel heterocyclics from the group of elements consisting of Boron, Carbon, Nitrogen, Aluminum, Silicon, and Phosphorus, the ultimate goal being the production of processible precursors for novel ceramics of unusual properties. The major efforts under the program were devoted to development of processible preceramic systems leading to aluminum nitride and multi-element nitride ceramics and ceramic materials. Aluminum nitride, in view of its high thermal conductivity, among other considerable properties, is of the interest in electronic applications, in particular in packaging of electronic microcircuits. ABSTRACT: (U) This research sought to produce a massively-parallel network architecture that could interpret speech signals from video recordings of human talkers. This report summarizes the project's results: (1) A corpus of video recordings from two human speakers was analyzed with image processing techniques and used as the data for this study; (2) We demonstrated that a feedforward network could be trained to categorize vowels from these talkers. The performance was comparable to that of the nearest neighbors techniques and to trained humans on the same data; (3) We developed a novel approach to sensory fusion by training a network to transform from facial images to short-time spectral amplitude envelopes. This information can be used to increase the signal-to-noise ratio and hence the performance of acoustic speech recognition systems in noisy environments; (4) We explored the use of recurrent networks to perform the same mapping for continuous speech. Results of this project demonstrate the feasibility of adding a visual speech recognition component to enhance existing speech recognition systems. Such a combined system could be used in noisy environments, such as cockpits, where improved communication is needed. This demonstration of presymbolic fusion of visual and acoustic speech signals

ABSTRACT: (U) Two series of experiments are reported on the role of prosody in human speech comprehension. One series looked at the role of prosodic information in listeners' ability to recognize adjacent vowels and consonants cued by the common temporal feature of vowel duration. The stimuli consisted of syllables from a large sample of natural speech which listeners heard with prosodic context or without. Prosodic context was found to aid listeners in correctly attributing the phonological source of vowel duration. The second series of experiments examines the role of stress in syllable accessibility during the on-line comprehension of language and from short-term memory. During on-line comprehension stress is found to interact with lexical processing, while the effect of stress on syllable accessibility from short-term memory is not dependent on lexical effects. Partial contents: Disambiguation of segmental dependencies by extended phonetic context; and coming to terms with stress -- Effects of stress location in sentence processing.

ABSTRACT: (U) Suppose a measure  $\mu$  dominates a measure  $\eta$  in the ordering induced by the excessive functions of a transient Markov process. Rost shows that  $\eta$  can be represented as the distribution of the process stopped at a randomized optional time and started with initial distribution  $\mu$ . In this paper we introduce the shift operator to the class of randomized optional times, including the class of randomized quasi-terminal times and that of randomized terminal times. We analyze the algebraic properties of these classes and obtain some compactness results for the class of randomized quasi-terminal times. Some applications, including remplissage by hitting times, are presented. (Author) (kr)

ABSTRACT: (U) The singer server M/G/1 queue subject to Poisson interruptions has many useful applications in computer systems modeling. The interruptions are usually characterized by their type of service-preemption discipline. This paper deals with this model in its most general setting, allowing the simultaneous presence of all types of interruptions that may be encountered in real systems. In spite of the inherent complexity of the analysis, it is possible to derive analytic closed form expressions for interesting performance measures. The results obtained are of theoretical interest as well as of practical significance. In particular, we derive the Laplace Stieltjes transform of the completion time associated with a customer's service and obtain the steady-state average number of customers in the system. An application to the modeling of checkpointing and recovery in a transactional system is considered. (Author)

UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Pub. in Physics Letters A, v145 n2.3 p141-145, 2 Apr 90.

ABSTRACT: (U) Positronium decay rates have been measured in silica gels of various pore sizes, at two temperatures, 297 and 77 K, and as a function of oxygen concentration. The cross section of positronium quenching due to a monolayer of adsorbed O<sub>2</sub> at 77 K is found to be at least two orders of magnitude smaller than the cross section for conversion quenching by subsequent layers, and is similar to that observed in gaseous oxygen. No evidence of chemical quenching has been observed. The positronium 'atom' occurs in two ground states. Parapositronium (p-Ps) is the singlet state with total spin of zero and it has a self annihilation lifetime in vacuum of 0.125 ns, and decays via 2 gamma emission. Orthopositronium (o-Ps) is the triplet state with total spin of one. Its free space lifetime is much longer, 140 ns, and decays via 3 gamma emission. (JS)

DESCRIPTORS: (U) \*ATOMS, \*POSITRONIUM, ANNIHILATION REACTIONS, CHEMICALS, CONCENTRATION(CHEMISTRY), CONVERSION, CROSS-SECTIONS, DECAY, GASES, GELS, GROUND STATE, LIFE SPAN(BIOLOGY), OXYGEN, QUENCHING, RATES, SILICON DIOXIDE, TEMPERATURE.

ABSTRACT: (U) High-pressure Raman spectroscopy is used to monitor the hydrolysis reaction of tetramethyl orthosilicate, TMOS, in solutions with methanol, acetonitrile, acetone, dioxane and formamide. The rate constants are experimentally determined for different temperatures and pressures. The volume of activation, dielectric constant, and vibrational frequency shifts are experimentally determined and discussed in terms of solvent properties. The acceleration of hydrolysis in formamide is explained in terms of interactions between formamide and TMOS. (JS)

UNCLASSIFIED REPORT

ABSTRACT: (U) The objective of this program is to evaluate the dependence of pseudomorphic InxGa1-xAs quality on epitaxial growth conditions and InxGa1-xAs composition. All of the structures were fabricated by molecular beam epitaxy (MBE). The effects of different growth conditions were evaluated with a combination of characterization techniques, including Hall effect, Shubnikov-de Hass, photoreflectance, microwave reflectance, photoluminescence, transmission electron microscopy (TEM), and in-situ reflection high energy electron diffraction (RHEED). Critical layer thickness is shown to be a function of MBE growth temperature. Also, the interruption of InxGa1-xAs growth with a few monolayers of GaAs is shown to smoothen the InxGa1-xAs surface to provide strain relief, substantially extending the critical layer thickness. Modulation enhanced epitaxy is demonstrated to yield high quality pseudomorphic structures at temperatures as low as 300 C. Extensive materials characterization and modeling were applied to the structures, and excellent agreement was often obtained without resorting to adjustable parameters. Keywords: Epitaxy, Pseudomorphic heterostructures, Stained layer superlattices, Dislocations, Photoluminescence, Hall effect, Electron diffraction, Photoreflectance. (JS)

## UNCLASSIFIED REPORT

ABSTRACT: (U) This Final Technical Report constitutes a summary of the research performed under Grant AFOSR-86-0026 during the period November 1, 1986 through April 30, 1990. First we present a list of the personnel involved in the research effort. Then in the following section we present a brief summary of the research results that have been achieved. Each of these results is well documented in technical articles, and references to these articles are made in the summary of the research results. Keywords: Estimation theory, Martingale convergence theorem. (KR)

DESCRIPTORS: (U) \*INFORMATION THEORY, \*SIGNAL PROCESSING, \*STRUCTURAL ANALYSIS, \*COMMUNICATION AND RADIO SYSTEMS, CONVERGENCE, ESTIMATES, PROBABILITY, THEOREMS, THEORY.

## UNCLASSIFIED REPORT

ABSTRACT: (U) The crystal and molecular structures of organic compounds, ((CH<sub>3</sub>)<sub>2</sub>AlNH<sub>2</sub>)<sub>3</sub> 1 and ((t-C<sub>4</sub>H<sub>9</sub>)<sub>2</sub>AlNH<sub>2</sub>)<sub>3</sub> 2, have been determined in connection with their investigation as possible precursors to aluminum nitride. Both compounds have an (AlN)<sub>3</sub> ring-structure with distorted tetrahedral geometries for the ring Al and N atoms. The distortion from tetrahedral geometry is most pronounced for the N atoms where the endocyclic Al-N-Al bond angles average 125.3 for 1 and 134.2 for 2. The (AlN)<sub>3</sub> ring in 1 is in a skew-boat conformation with no unusual intra- or intermolecular contacts. Compound 2 on the other hand exhibits an unprecedented planar (AlN)<sub>3</sub> ring as required by a crystallographic three-fold symmetry axis. Keywords: Ceramic precursor, Aluminum nitride, Dialkylaluminum amides, Crystal structure, Molecular structure. (JS)

DESCRIPTORS: (U) \*ORGANIC COMPOUNDS, ALUMINUM COMPOUNDS, AMIDES, ATOMS, CERAMIC MATERIALS, CRYSTAL STRUCTURE, DISTORTION, GEOMETRY, MOLECULAR STRUCTURE, NITRIDES, PLANAR STRUCTURES, PRECURSORS, SYNTHESIS.

UNCLASSIFIED REPORT

ABSTRACT: (U) The prospect of alloying SiC with other covalently bonded refractory materials, such as AlN, to achieve microstructural control or alter properties has been previously noted and realized under certain conditions. However because of the high melting points and low solid-state diffusivities which are characteristic of these materials, currently available ceramic processing methods, such as sintering or hot-pressing, are of limited practical value as a means of obtaining chemically and microstructurally homogeneous materials in useful final form. The influences of the nature of the precursor and processing conditions on the structure, composition, and purity of the SiC/AlN materials are discussed. Keywords: Silicon carbide, Precursors, Aluminum nitride, Solid solutions, Pyrolysis. (JS)

p6485-6504, 1 Jun 90.

ABSTRACT: (U) A theory for ultrafast pump-probe spectroscopy of large polyatomic molecules in condensed phases is developed. A multimode Brownian oscillator model is used to account for high-frequency molecular vibrations and local intermolecular modes as well as collective solvent motions. A semi-classical picture is provided using the density matrix in Liouville space. The pump field creates a doorway state that propagates for a specified time interval, and the spectrum is calculated by finding its overlap with a window state, prepared by the probe pulse. The doorway and the window states are wave packets in phase space. For high-frequency modes and with long pulses they are expanded in the vibronic eigenstates, whereas for low-frequency modes and with impulsive pulses the Wigner (phase-space) representation is more adequate. Conditions for the observation of quantum beats, spectral diffusion, and solvation dynamics (dynamical Stokes shift) are specified. (JS)

UNCLASSIFIED REPORT

ABSTRACT: (U) The ionic mechanism of soot formation assumes rapid growth of ions from the chemion C3H3+ to form increasingly larger ions which either become incipient charged soot particles or combine with electrons (produced in the chemion step) to produce incipient neutral soot particles. A comparison of the rates of soot formation demonstrates that the rate of ion formation with the rates of soot formation demonstrates that the rate of ion formation exceed the rate of soot formation, and that the rate at which ions disappear is approximately equal to the rate at which soot is formed. In addition, ions are observed to disappear at the same point in the flame at which soot is observed to form. The time it takes to add 10 carbon atoms, i.e., to grow from C10 to C20 species, is compared for the neutral and ionic mechanisms. These times, using experimentally measured species concentrations and typical rate coefficients, are comparable for the two mechanisms. Keywords: Soot formation; Ionic mechanism; Ion-molecule reactions. (JS)

ABSTRACT: (U) Diatomic van der Waals molecules  
consisting of metal atom bound to a rare gas atom (MRg)  
have received considerable attention in recent years.  
Studies of the electronic spectra of these molecules have  
led to determinations of the interatomic potential energy  
curves for both ground and electronically excited states.  
These data are of value as they may be used in the  
analysis of dynamical events such as collisional line  
broadening, electronic energy transfer, and molecular  
beam scattering. Additionally, spectroscopic  
characterization of these molecules provides a data base  
against which ab initio and semi-empirical theoretical  
models of weak bonding interactions may be tested. An  
interesting property of many MRg molecules in dramatic  
increase in binding energy, and decrease in the  
equilibrium internuclear separation, which accompanies  
electronic excitation. This occurs because bonding in the  
ground state is predominantly mediated by dispersion  
forces, while the stability of the excited state may be  
enhanced by increased metal atom polarizability, partial  
charge transfer, and orbital overlap effects. (JS)

ABSTRACT: (U) We study optimally bounded score functions  
for estimating regression parameters in a generalized  
linear model. Our work extends results obtained by  
Krasker and Welsch (1982) for the linear model and  
provides a simple proof of Krasker and Welsch's first-  
order condition for strong optimality. The application of  
these results to logistic regression is studied in some  
detail with an example given comparing the bounded-  
influence estimator with maximum likelihood. Keywords:

ABSTRACT: (U) A reparametrized version (PM3) of AM1 has  
recently been reported and the results for several  
hundred molecules compared with those from AM1 itself.  
The comparison implied that PM3 represents a significant  
improvement over the earlier treatment. The apparently  
poor performance of AM1 is, however, due to the inclusion  
of 'AM1' results for elements (Al, P, S) for which AM1  
parameters were unavailable. If these are omitted, PM3 is  
seen to be only marginally better than AM1. Since this  
conclusion refers only to a specific set of stable  
molecules, it is not clear whether even this small  
improvement will apply to other species or studies of  
reactions. Keywords: Chemical reactions, Inorganic

ABSTRACT: (U) The objective of this project was to examine relationships of selected metabolic capabilities and key immunological functions of activated macrophages. Consistent association or a single example of dissociation between two parameters would indicate or eliminate the possibility of common induction pathways or functional interdependence of these parameters. Results indicate that thiol production, capacity to produce H2O2, and tumor cytotoxicity are often induced by the same stimuli, but, in one case, H2O2 production was not affected by stimuli which increased the other two parameters. The commonly accepted idea that highly activated (tumoricidal) macrophages are poor antigen processing and presenting cells was confirmed, but some tumoricidal activity was noted in macrophages which were excellent antigen processing and presenting cells. UNCLASSIFIED REPORT

ABSTRACT: (U) A model of multi-level coding of spatial location was developed. According to the model people impose categories on homogeneous spaces. In coding location, they report both a particular value and a category value. These values are combined in reporting location. Categories have boundaries which constrain the particular values reported, and particular values are weighted with prototypic central values in estimation. The proposed estimation process, it is shown, increases accuracy, while introducing bias. Four experiments were carried out in which people reported the location of a dot in a circle. The pattern of bias revealed that people imputed horizontal and vertical axes dividing the circle into quadrants. Using the mathematical formulation of the category model, we showed that the model fully explained the pattern of bias observed in the studies. (KR)

p425-432 1990.

ABSTRACT: (U) The thermal behavior of several  
polyphosphazenes was examined. The polymers were studied  
by thermogravimetric analysis between 50 and 100 C, by  
bulk pyrolysis in a tube furnace over the same  
temperature range, and by thermolysis in a closed system.  
The volatile products were analyzed by a combination of p  
NMR spectroscopy, vapor-phase chromatography, and mass  
spectrometry. Three distinct processes were identified:  
(1) random chain cleavage of the phosphazene backbone, (2)  
depolymerization to form small molecule cyclic  
phosphazenes, and (3) cross-linking reactions to form a  
network structure. Keywords: Phosphazenes, Polymers,

ABSTRACT: (U) Previous work has shown that the heats of  
unstrained conjugated molecules can be reproduced with  
surprising accuracy by a semiempirical SCF MO treatment  
(DEWAR-PI) based on the Pariser-Parr-Pople (PPP) pi SCF  
MO Approximation. The original version failed to allow  
for rising strain. This deficiency has now been remedied  
in a new version (DEWARPI2). Crystallography. (JS)

ABSTRACT: (U) An electron spin resonance spectroscopy  
technique is employed to investigate in situ the kinetics  
of surfactant adsorption on colloidal particles. Using  
this technique, it was found that 40% of the adsorption  
of Aerosol OT at the alumina/cyclohexane interface takes  
place within 5 s after addition of the surfactant to the  
suspension. Keywords: Surfactant; Macromolecules.  
Adsorption; Aerosol, Kinetics; Colloidal systems. (jes)

SUPPLEMENTARY NOTE: Pub. in Jnl. of the American Ceramics Society, v73 n7 p2131-2133 Jul 90.

ABSTRACT: (U) Photochemical and thermal reactions of small amounts (0.25-2wt%) of polynuclear metal carbonyls (Ru3(CO)12, Fe3(CO)12, Os3(CO)12, Co2(CO)8, Co4(CO)12, Rh6(CO)16) serve to cross-link Si-H containing organosilicon polymers. As a result, when the products of these reactions are pyrolyzed, the ceramic residue yields are increased considerably over those obtained with the original polymers. The organosilicon polymers studied most were the Nicalon polycarbosilane and the (CH3SiH)x(CH3Si)yn polysilane. (js)

ABSTRACT: (U) The reaction of H3B.S(CH3)2 with the (CH3SiH)n cyclic oligomers obtained by ammonolysis of methyldichlorosilane (CH3SiHCL2) results in evolution of hydrogen and formation of cross-linked products that contain borazine rings as well as boron atoms that are linked to three nitrogen atoms. Pyrolysis of the products in a stream of argon gives a high yield of a black borosilicon carbonitride, whereas pyrolysis in a stream of ammonia gives white borosilicon nitride in high yield. Keywords: Borosilicates, Boron nitride, Silazanes, Pyrolysis, polymers. (js)

ABSTRACT: (U) A high molecular weight linear polycarbosilane has been prepared by ring-opening polymerization of 1,3-dichloro-1,3-dimethyl-1,3-disilacyclobutane. Reduction of this polymer with LiAlH<sub>4</sub> yields the corresponding polysilapropylene. The structures of these polymers and their monomeric precursors have been investigated by IR and <sup>1</sup>H, <sup>13</sup>C, and <sup>29</sup>Si NMR spectroscopy, mass spectra, and GPC. The results of these studies are consistent, in the case of the polymers, with expectations for high molecular weight linear polymers with atactic configurations. The pyrolysis of the high molecular weight poly(silapropylene) was studied by TGA and was found to give a 66% ceramic yield after thermal processing at 400 C, suggesting that this polymer has potential for use as a precursor to SiC ceramics. Keywords: Polycarbosilane, SiC Precursor, Ring opening, Polymerization, Polysilapropylene. (js)

SUPPLEMENTARY NOTE: Pub. in Jnl. of Chemical Physics, v92 n11 p6820-6826, 1 Jun 90.

ABSTRACT: (U) We have used an ab initio SCF molecular orbital approach in conjunction with the isodesmic reaction procedure to investigate anomalous energy effects in strained aza systems and some of their nitro derivatives. The introduction of nitrogens into strained molecular frameworks is found to confer added degrees of stability. In general this increases with the number of nitrogens in a series of similar molecules. Further stabilization results from N-nitro substitution and the mononitration of secondary carbons; however the polynitration of systems containing highly strained tertiary carbons has a marked destabilizing effect. Keywords: Ab initio self-consistent-field molecular orbital calculations; Isodesmic reactions; Strained aza systems; Nitro derivatives; Strain energy. (js)

ABSTRACT: (U) The theory of analyzing molecular energies, as found from ab initio computations, in terms of the contributions from specific sets of atoms or centers is discussed. It is shown that the basis-function expansion of molecular wavefunctions in general leads to energetic interactions involving only one- through four-center terms. For the special case of self-consistent-field energies the formulas for the energy terms are given explicitly and several numerical properties are presented, including the differences that arise in chemical reactions. Expressions are also given for the multicenter resolution of correlation energies employing second-order perturbation theory. Keywords: Molecular energies, perturbation theory, Energy partitioning. ABSTRACT: (U) Spectra of the A 2sigma(+) - X 2pi transitions of OH-Ar and OD-Ar have been observed in the gas phase and in cryogenic rare-gas matrices. Laser-induced fluorescence spectra of gas-phase OH/D-Ar showed two distinct vibrational progressions associated with motion of the Argon atom. Rotationally resolved spectra for bands of the lower energy progression revealed contours that were consistent with linear molecules. This progression, which was also observed for matrix-isolated OH/D-Ar, has been unambiguously assigned to the OH(D)-Ar stretch mode of the A state. (js)

UNCLASSIFIED REPORT

ABSTRACT: (U) Four research goals were accomplished: (1) It was determined that sensory responsiveness of primary somatosensory (SI) cortical neurons to vibratory stimuli is quantitatively different depending upon whether monkeys make wrist movements in response to the stimuli or withhold movement. (2) For a special class of SI neurons, it was determined that activity occurring before movement is comprised of a reactivation of the neuron's sensor response and a presumably centrally generated component. (3) It was determined that sensory responsiveness and premovement activity are elevated when behavioral conditions are unpredictable as compared to when they are predictable. (4) It was determined that human subjects can acquire a positional target by wrist movements more quickly if vibratory go-cues are presented in addition to the illumination of a visual signal lamp. The neurophysiological experiments suggest that the responsiveness of SI neurons is profoundly affected by behavioral conditions and an animal's expectation of correct performance. The human psychophysical experiments suggest that the addition of vibratory go-cues to control systems may have benefits without seeming to degrade performance.

ABSTRACT: (U) Development of a new boundary layer code has reached the status to permit meaningful applications. Computations have been carried out for the initiation of separation in the symmetry plane of a prolate spheroid of slenderness ratio 1/4. Impulsively started into forward motion at zero incidence and also at 50 degrees angle. This case serves as validation by comparing with previously published results of Xu and Wang (ref. 1), and also demonstrates that our method gives information of flow near the rear stagnation point not available in the literature. More studies have been performed on the optimization of surface suction to delay or prevent the unsteady separation for an impulsively started circular cylinder. Here the methodology should be of interest. Work on an unsteady three-dimensional thin-layer Navier-Stokes code, however, is progressing slowly. Keywords: Unsteady separation, three dimensional moving body, Separation control. (jhd)

UNCLASSIFIED REPORT

ABSTRACT: (U) Two drop/gas interactions important in the near-injector dense region of sprays are being studied: (1) turbulence modulation, which is the direct generation or modification of turbulence by drop motion, and (2) secondary drop breakup, an important rate-controlling process in dense sprays. Effects of turbulence modulation were measured in homogeneous flows generated by particles falling in stagnant air and water baths. The flow was analyzed with a simple stochastic approach, involving linear superposition of randomly-arriving particle velocity fields. Guided by the theory, unified correlations of turbulence properties were achieved for the measurements. Further progress requires more information about particle wake properties at modest Reynolds numbers in turbulent fields: this is the main focus of current work. Secondary drop breakup is being studied using a shock tube and various drop generators, emphasizing near-limit breakup which is most relevant to dense sprays. Work thus far has concentrated on definition of deformation and shear breakup regimes. This will be followed by study of breakup dynamics and outcomes using holocinematography instrumentation that was recently developed in this laboratory. Keywords: Multiphase flow, Homogeneous turbulence, Drop breakup. (jhd)

UNCLASSIFIED REPORT

ABSTRACT: (U) The goal of this investigation was to understand the neural computations that mediate the precision of human spatial vision. We approached this goal along three interrelated lines of research: (1) direct investigation of human and monkey retinal sampling mosaics; (2) psychophysical measurements of the precision of human spatial vision; and (3) computer simulations of human visual processes based on 'biologically correct' sampling lattices and behaviorally constrained neural models of human spatial information processing.

ABSTRACT: (U) The primary objective of our research is to develop efficient and numerically stable algorithms for nonstationary signal processing problems by understanding and exploiting special structures, both deterministic and stochastic, in the problems. We also strive to establish and broaden links with related disciplines, such as cascade filter synthesis, scattering theory, numerical linear algebra, and mathematical operator theory for the purpose of cross fertilization have led to new results both in estimation theory and in these other fields, e.g., to new algorithms for triangular and QR factorization of structured matrices, new techniques for root location and stability testing, new realizations for multiple-input/multiple-output (MIMO) transfer functions, and new recursions for orthogonal polynomials on the unit circle and the real line as well as on other curves. ABSTRACT: (U) The overall goal of this project is to understand the ability of the human listener to extract information from complex, time-varying sounds such as speech, music or other environmentally important signals. Specifically, we are interested in the listener's ability to process modulations of frequency and amplitude which are thought to carry the information of such signals. This report represents the continuation and extension of work begun at the University of Kansas in 1987. Preliminary work to determine the temporal acuity of normal hearing listeners for spectrally-dynamic signals is complete. Pilot work on processing of frequency transitions in a 'proving frequency' paradigm has been started; and work on listeners with cochlear hearing impairments has been added to the scope of work undertaken on the project.

ABSTRACT: (U) A major problem in attempting to understand complex physiological processes, such as brain neuromodulation, or complex behavioral processes, such as arousal, is finding a simple system that will permit such analyses. The brain stem masseteric (jaw closure) reflex in cats in such a system. It is simple, containing only one synapse in brain, and receives dense inputs from two neurochemical systems important in neuromodulation and arousal. Initial pharmacologic studies showed that locally applied norepinephrine facilitated the reflex response. More importantly, physiologic conditions, known to activate the brain norepinephrine system, also facilitated the response. This latter finding was shown to be causal, rather than correlative, by a study which found that the facilitation could be blocked by prior destruction of the norepinephrine input specifically to the reflex circuitry. These data represent the first definitive example of an activational effect in an intact and behaving organism being attributable to a particular central neurotransmitter acting at a specific brain site. (js)

UNCLASSIFIED REPORT

ABSTRACT: (U) The results of a multi-year research effort addressing fundamental scientific issues relevant to the application of laser diagnostic methods as on-line sensors in next-generation propulsion systems are summarized. The overall objective of this research effort was to contribute to the scientific knowledge base necessary to characterize and then extend the capabilities of near-forward scattering (laser-diffraction) particle sizing techniques in terms of application as intelligent sensors capable of on-line, autonomous, and self-diagnosing operation in hostile propulsion system environments. The project scope encompassed three research areas: (1) steering or deflection of the probe laser beam due to refractive index (temperature or concentration) gradients, (2) inverse scattering algorithms, and (3) multiple scattering and measurements in optically thick media. The important technical contributions of this project included: development and demonstration of a concept which allows on-line configuration of optimal detector arrays using transmission-mode spatial light modulators and which can obviate the beam steering problem; derivation of the optimal scaling law for Fraunhofer diffraction particle sizing systems which integrated the

ABSTRACT: (U) The accomplishments during this contract period have been related to the development of a multi-beam interferometer system, which would utilize a CO2 laser system for high sensitivity, to eventually be used to diagnose plasma in the electromagnetic expansion region of a plasma thruster. Since the application of interest is a 1/4 Scale MPD experiment, funded by NASA, where plasma is poorly known, the CO2 laser interferometer will first be tested with a single beam on a DC discharge experiment whose plasma characteristics are well known. That experiment has been assembled and tested. The CO2 laser system has been tested and found to be satisfactory. Keywords: Carbon dioxide lasers, Plasma Diagnostics, Plasma thrusters. (jhd)

ABSTRACT: (U) This Final Report describes the synthesis and characterisation of compounds containing metal-metal bonds between dissimilar transition elements. The new compounds reported included species with chains or rings of metal atoms, involving tungsten or molybdenum bonded to the elements nickel, platinum, rhodium, or iridium. The Report also describes numerous mixed-metal compounds in which the metal-metal bonds are bridged by the carbaborane group C<sub>2</sub>B<sub>9</sub>H<sub>9</sub>R<sub>2</sub> (R = H or Me). A variety of unprecedented molecular structures have been identified by X-ray crystallographic studies. Keywords: Cluster compounds of platinum, Nickel, Molybdenum, Tungsten, Rhodium, Iridium, Iron, Ruthenium, Gold. (Js)

ABSTRACT: (U) The efficient evaluation of microcanonical and canonical variational transition state rate constants by Markov sampling techniques is discussed. It is well known that, in the evaluation of canonical rate constants, sampling the full phase space of the system is unnecessary and that an equivalent and far more efficient procedure is to perform a Markov walk over configuration space. It is shown that an analogous improvement in efficiency is possible in the case of microcanonical rate constants. The close relationship of canonical and microcanonical average is observed. Keywords: Reprints. (Author) (RH)

ABSTRACT: (U) Ab initio enthalpy computations were carried out for over 40 gas-phase diamagnetic molecules, including 18 hydrocarbons. All employed optimized geometries, a wide range of basis sets and a series of electron correlation approximations based on perturbation theory (through MP4SDTQ) and the coupled-cluster model (through CCSDT). The energies of forming the various molecules from the nuclei and electrons were calculated from experimental data and compared with the various ab initio values. The enthalpies at 298K of chemical reactions between molecules were considered in terms of the disagreement between the experimental and theoretical enthalpies, with emphasis on generic classes of reactions. The generic reactions showed up regularities in disagreements between theory and experiment. Reasons for occasional large disagreement were probed. Keywords: Reaction energy, Enthalpies, Electron correlation, Thermodynamics. (JS)

## UNCLASSIFIED REPORT

ABSTRACT: (U) Carbon fibre interfaces with epoxy resins have been examined using the pull out method. This method can now be reliably and reproducibly used to measure the bond strength. Shear strengths can be very high, up to nearly 150 MPa in individual experiments, with average values for 50 or more tests of up to 100 MPa. The strengths are little different for Hercules AS1, AS2 and AS4. The sizing appears to have little effect (but this needs to be confirmed). The strengths observed are up to three times the shear strength of the polymer. Carbon and glass interfaces with thermoplastics (polyethylene and nylon) can also be measured using this method. Results here are up to four times the estimated shear strength of the polymer. To explain the high results an equivalent work of fracture is involved. This has never exceeded 300 Jm<sup>-2</sup>, indicating that the interphases are quite brittle. Keywords: Fibre reinforces polymers, Composites. (js)

AD-A226 791

ABSTRACT: (U) This research consists of an experimental study of the time dependent combustion in vortex structures. Large vortices were formed utilizing pulsed flow over a downstream facing step. The technique for simultaneous shadowgraph, chemiluminescence, and laser doppler velocimeter measurements has been developed and is used regularly. For a pressure oscillation of fixed amplitude, the diameter of the vortex grows linearly with time at a rate that increases linearly with the pressure amplitude of the oscillation generating the vortex formation. The onset of chemiluminescence - and we believe combustion - is delayed for several milliseconds, close to our estimates for the chemical time for the systems under study here. Keywords: Vortex burning, Unsteady combustion, Shock enhanced mixing, Supersonic combustion, Hypersonic ramjet. (jhd)

UNCLASSIFIED REPORT

ABSTRACT: (U) Neural networks represent a promising alternative to traditional artificial intelligence approaches. The development of analog optical implementations of neural networks such as the multilayer perceptron with learning by backward error propagation (BEP) requires an understanding of the noise sensitivity of such architectures. The objective of this program is to study the effects of component and system noise on the performance of such optical implementations. The method used is computer simulation. In this first phase of the program, the one-hidden layer perceptron with back propagation was simulated using a simplified, device-independent noise model. The results point to a distinct noise threshold above which the learning mechanism is corrupted. The efficiency of learning based on variations within back propagation on the initializing method was also studied. In the next phase, a device-dependent noise model will be used. To this end a plausible all-optical architecture capable of both the forward pass and backward error propagation steps of training data presentation has been proposed. Author (kr)

ABSTRACT: (U) Investigation into whether the cognitive mechanism of suppression underlies differences in adult comprehensions skills are reported. Less-skilled comprehenders less-efficiently reject the inappropriate meaning of ambiguous words (e.g., the playing card vs garden tool meaning of spade), the incorrect forms of homophones (e.g., patients vs patience), the highly-typical-but-absent members of scenes (e.g., tractor in a farm scene), and words superimposed on pictures of pictures surrounding words. However, less-skilled comprehenders are not less cognizant of what is contextually appropriate, in fact, they benefit from a biasing context just as much (and perhaps more) as more-skilled comprehenders do. So, comprehenders do not have difficulty enhancing contextually appropriate information. Instead, it is suggested that less-skilled comprehenders suffer from less-efficient suppression mechanism, which we conclude is an important component of general comprehension skill. (sdw)

ABSTRACT: (U) The overall goal of these studies is to  
characterize the effects of noradrenergic (NA) afferents  
on cortical information processing. Our previous studies  
indicate that the primate locus coeruleus (LC) system,  
originating in the pontine brainstem, innervates  
neocortex more densely than previously thought,  
exhibiting highly specific patterns in terms of the  
regional and laminar distribution of its axons across the  
neocortex. Previous neurophysiological observations  
suggest that this highly divergent system imposes state-  
related modulatory effects on thalamo-cortical and  
cortico-cortical systems. For example, we have shown that  
primate LC-NA neurons are more active during waking than  
sleep and exhibit bursts of activity during increases in  
attentiveness. Keywords: Locus coeruleus, noradrenergic,  
Event-related potential. (js)

UNCLASSIFIED REPORT

ABSTRACT: (U) We have investigated a new type of millimeter wave oscillator device based on a resistive gate MESFET structure. The resistive gate establishes a uniform electric field in the regime of negative differential mobility for electrons in GaAs. At these fields, dipolar charge domains form in the channel and drift into the drain, producing microwave oscillations in the drain current. In the contiguous domain mode, a continuous sequence of charge domains forms throughout the channel. This mode is possible because the resistive gate screens the self-induced fields of each dipolar domain, keeping the field outside the domain unperturbed. Frequencies up to 100+ GHz are predicted, independent of channel length, and the frequency should be tunable over at least one octave by varying the gate-to-source voltage. This mode has not yet been observed experimentally, since the gate resistivity on our prototype devices has been too large. These devices are presently operating a single domain transit time mode, producing oscillations in the 6 to 28 GHz range for channel lengths from 5 to 20 micron. Work is continuing to reduce the gate resistivity so that the contiguous domain mode can be observed. (rrh)

ABSTRACT: (U) This report provides a detailed account of equipment purchases made under a DoD University Research Instrumentation Grant (AFOSR-89-0135). The equipment includes a Silicon Graphics IRIS 4D/120GTx workstation and a variety of hardware components which have been selected as components of real-time server network designed to support a graphical interface to experiments in the control of mechanical systems. A brief description is provided of the resulting hardware implementation and its use in controlling three different experimental systems-a flexible beam, a rotating kinematic chain, and a six axis industrial robot. A detailed breakdown of expenditures is provided. (rh)

ABSTRACT: (U) The problem considered is the robust estimation of the variance parameter in a heteroscedastic linear model. We treat the situation in which the variance is a function of the explanatory variables. To estimate robustly the variance in this case, it is necessary to guard against the influence of outliers in the design as well as outliers in the response. By analogy with the homoscedastic regression case, we propose two estimators that do this. Their performances are evaluated on a number of data sets. We had considerable success with estimators that bound the self-influence-that is, the influence an observation has on its own fitted value. We conjecture that in other situations (e.g., homoscedastic regression) bounding the self-influence will lead to estimators with good robustness properties. Keywords: Reprints. (Author) (kr)

UNCLASSIFIED REPORT

ABSTRACT: (U) This research extended our understanding of the visual and cognitive process controlling saccadic and smooth eye movements, and the role of these eye movements in visual information acquisition. Experiments showed that: (1) saccades are biased toward likely locations of targets, suggesting that previous reports of 'center-of-gravity' reflexes are actually due to search of attentional strategies; (2) saccades can be directed to spatially-extended targets with an accuracy and precision as good as those found for single point targets; (3) predictive smooth eye movements are caused by cognitive expectations about future path of target motion, not by learned oculomotor habits; (4) slow control is not sensitive to position error; (5) smooth eye movements are sensitive to the expected direction of future target motion; (6) strategies of scanning the boundaries of difficult texture patterns are more effective than strategies of scanning the symmetric axis; (7) normal reading is carried out by a coordinated pattern of eye movements and head movements.

UNCLASSIFIED REPORT

ABSTRACT: (U) In general, neutral-free radicals can bind to a rare gas atom through electrostatic forces, charge transfer, and, when hydrogen is present, hydrogen bonding. The relative importance of these types of bonding may be deduced from spectroscopic analysis of the rotational structure of these complexes. Rare gas atom-diatomic radical complexes are the simplest polyatomic prototypes for initial investigations. The geometry of such a complex, determined from the rotational structure, provides valuable qualitative information concerning the dominant bonding mechanism. Finer details of the intramolecular interactions will be reflected in the spin-rotation and hyperfine coupling constants. When the radical possess electronic orbital angular momentum, additional insight can be gained from the effect of complex formation on the spin-orbit coupling. (js)

ABSTRACT: (U) Quantum 1/f noise is basic property of physical cross sections and process rates and a form of quantum chaos in the nonlinear system of the charged particles plus the electromagnetic field. Therefore, the present report starts with a consideration of the general problem of 1/f spectra in nonlinear systems, derives for the first time a general sufficient criterion which tells us if a system will show 1/f noise, and applies the new criterion to transport in semiconductors, in metals, on highways, and in quantum electrodynamics. In all these cases 1/f spectra follow from the same criterion, in the same way. This is, for the first time, a unifying principle. In addition, the report contains the first rigorous first principles derivation of quantum 1/f mobility fluctuations in semiconducting materials (analytical) and reference to a Monte Carlo simulation of the same problem. Finally, a solution for the long-standing problem of quantum 1/f noise in the collector of BJT's is proposed. (rrh)

ABSTRACT: (U) Under this grant, the following equipment was purchased: 7 SUN 3/50 workstations; 1 SUN 3/260 workstation; 1 SUN 3/180 file server; 1 CDC disk; 1 Eagle disk; 2 Apple Laser Writer printers. This equipment was of utmost importance in our research in the Scientific Computing and Computational Mathematics Program at Stanford. In particular, it allowed us to analyze, devise, and study various numerical algorithms associated with our research activity. I enclose a list of recent reports which depended heavily on the use of this equipment. Here are some special activities: The Lanczos method is a well known method for computing the eigen-values of symmetric matrices. For many years there has been an attempt to generalize this algorithm for matrices that are non-symmetric. There have been inherent difficulties, and for a long time it was not understood how to modify the algorithm for the non-symmetric case. In the last year, it has finally been understood how to formulate a stable and robust algorithm. We were able to develop numerical software for operating on non-symmetric matrices. (kr)

ABSTRACT: (U) Laser-induced fluorescence spectra have been recorded for systems of Ne-OH and Ne-OD. All of the transitions observed originated from the ground-state zero-point level. Ground-state rotational constants were found for the H and D isotopes, respectively. Bands corresponding to excitation of the van der Waals stretch and bend-stretch combinations were seen. The energy ranges encompassed by these bands provided lower limits for the van der Waals dissociation energies. Keyword: Inorganic chemistry. (JES)

ABSTRACT: (U) The general objective of this research is to improve on existing theoretical models for predicting the response of inelastic aerospace structural components subjected to hostile thermal environments with emphasis on transient temperature conditions, radiation boundary conditions, extremely rapid heating rates, and possible phase change of the materials involved. For materials subjected to the conditions under study herein it is necessary to perform extremely complex experiments in order to determine the precise form of the theoretical constitutive equations. Finally, it is necessary to implement the resulting equations to boundary value problem solving algorithms in order to model the response of structural components with stress, strain, and temperature gradient fields. ABSTRACT: (U) The work done under the URI had the mission to bridge ultrafast optics with high-speed electronic and photonics. Ultrashort optical pulses have been used to study of fundamental processes taking place in the femtosecond and picosecond timescales in bulk and layered semiconductors, metals, and superconductors. Under this contract electron velocity overshoot in GaAs was time-resolved for the first time. Using short optical and electrical pulses, both sequential and resonant tunneling transport were investigated. The high-frequency properties of high-Tc superconductors in the 10-100 GHz range were studied. Time-resolved thermo-modulation was used to investigate the electron phonon interaction in metals. This URI also had an important technological impact. Novel techniques and devices were demonstrated. In particular, time-domain reflectometry, based on electrooptic sampling to test devices and circuits at room and cryogenic temperatures was developed. We test HEMT, PBT, heterostructure transistor prescaler, NMOS silicon multiplexer, and GaAs power amplifier MMIC. Broadband electronic requires a complete understanding of normal and superconducting transmission lines. Extensive work has been done in this area. A time-temperature of the first high-energy electron diffraction technique was also demonstrated and used to determine the surface temperature of the first monolayers in crystals. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) Major improvements were introduced for neuromagnetic studies by the installation of a magnetically shielded room and versatile gantry to hold our 5-sensor neuromagnetometer. Studies with this system verify that the strength of the 100-ms component of the cortical response to a tone is unaffected by tone frequency and intensity at suprathreshold levels, but we have shown that both the 100-ms and 180-ms components are affected by attention. Moreover, we have obtained evidence that auditory cortex in left and right hemispheres may have differing responses to a tone depending on the inter-stimulus interval. Neuronal sources of certain components of auditory-evoked responses are found to be displaced across cortex from the others, with a tonotopic representation for the 50-ms transient component apparently differing from the representation for the steady-state component, which has a similar apparent latency. Studies of spatial attention have revealed robust effects for latencies exceeding 200 ms, unlike for the auditory system, but some subjects show effects commencing as early as 100 ms. An investigation of the classic P300 response for both visual and auditory stimulation has been initiated with a more efficient paradigm, and early results provide evidence that the neuronal source is independent of sensory modality. To address the question of how much cortex is involved in producing an evoked field or

potential, we have analyzed published data on intracortical voltage measurements in cat and monkey and found that the current dipole moment per square millimeter of cortical area is very much the same at moments of peak activity for long-latency responses. (SDW)

Networks, v1 n1 p58-70 Mar 90.

ABSTRACT: (U) Model-free learning for synchronous and  
asynchronous quasi-static networks is presented. The  
network weights are continuously perturbed while the time  
varying performance index is measured and correlated with  
the perturbation signals; the correlation output  
determines the changes in the weights. The perturbation  
may be either via noise sources or orthogonal signals.  
The invariance to detailed network structure mitigates  
large variability between supposedly identical networks  
as well as implementation defects. This local, regular,  
and completely distributed mechanism requires no central  
control, and involves only few global signals. Thus it  
allows for integrated, on-chip learning in large analog  
and optical networks. Keywords: Reprints, Artificial

UNCLASSIFIED REPORT

ABSTRACT: (U) Fault-tolerant computer systems change their level of performance (e.g., mode of operation or service rate) in response to different events such as failure, degradation or repair. We present a unified model for the analysis of job (task) completion time and the accumulated service (Reward) until a given time (also known as performability). In prior work, the evaluation of the distribution of performability was restricted to nonrepairable systems (represented by acyclic Markov chains). In this paper, we describe an algorithm for the numerical evaluation of the distributions of performability or job completion time, in repairable fault-tolerant systems (represented by cyclic Markov chains). We demonstrate the feasibility of our techniques by means of numerical examples. (Author) (KR)

ABSTRACT: (U) This program has involved a combined synthetic, processing, and physicochemical study of multifunctional, high-performance polymer systems rationally designed for certain unusual physical properties. In one thrust, the unique properties of the high modules/high strength macromolecules poly(p-phenylenebenzothiazole) (PBT) and poly (p-phenylenebisthiazole) (PBT) have been utilized to develop new kinds of electrically conductive polymeric and molecular/macromolecular hybrid materials. In the second thrust, several complementary approaches to the construction, evaluation, and fundamental understanding of new types of high-performance nonlinear optical materials have been pursued. Areas of emphasis have included chromophore-functionalized glassy polymers, chromophore-embedded crosslinkable matrices, inorganic/organic hybrid materials, crosslinked NLO films, the design of novel chromophores, and internally ordered polymeric NLO materials. Each research component has built upon past successes as well as upon strong on-going collaborations in laser optics and quantum theory. Keywords: Polymer, Nonlinear optics, Chromophore, Second harmonic generation. (JS)

ABSTRACT: (U) The characteristics of chromium-sensitized solid state lasers operating in the mid-infrared wavelength region have been studied. During the second year of research there was continued work on crystals doped with holmium and erbium, operating in the 2100-nm and 2800-nm regions. In addition, preliminary measurements were made on the laser performance of thulium around 2010 nm. For all these materials the effect of pump pulse length on output energy and overall efficiency has been measured. A flashlamp-pumped Cr,Nd:GSGG slab laser was operated and characterized at 1061 and 1310 nm. Measurements included comparison of normal mode slope efficiencies, input-output vs. pump pulse length, characterization of thermal lensing and measurement of Q-switched performance at 1061 nm. Spectroscopic properties of GGG crystals doped with Ce4+ ions were measured, including absorption and emission spectra and fluorescence lifetime. Keywords: Chromium sensitized solid state lasers, Mid infrared wavelength region. (js)

ABSTRACT: (U) The molecular dynamics of vibrationally excited 1,2-difluoroethane-d<sub>4</sub> isolated in Ar, Kr, and Xe matrices at 12 K are investigated using trajectory methods. The matrix model is an fcc crystal containing 125 units cells with 888 atoms in a cubic (5x5x5) arrangement. It is assumed that 1,2-difluoroethane-d<sub>4</sub> is held interstitially within the volume bounded by the innermost unit cell of the crystal. The transport effects of the bulk are simulated using the velocity reset method introduced by Riley, Coltrin, and Diestler (J. Chem. Phys. 88, 5934(1988)). The system potential is written as the separable sum of a lattice potential, a lattice-molecule interaction and gas-phase potential for 1,2-difluoroethane. The first two of these are assumed to have pairwise form while the molecular potential is a modified form of the global potential previously developed for 1,2-difluoroethane (J. Phys. Chem. 91, 3266(1987)). (jes)

ABSTRACT: (U) This report describes the concept formulation and demonstration for high symmetry composites by examination of the combination of spheres in 3-D fiber architectures. By computer simulation, the level of geometric symmetry composites, a finite cell model and a finite element code for the analysis of sphere have been developed. A method for the fabrication of the high symmetry system has also been developed. Keywords: High symmetry composite, 3-D Fiber architecture, Spherical reinforcement, Finite cell modeling. (js)

ABSTRACT: (U) Structural modeling requires the construction of an appropriate mathematical description to describe the behavior of a physical object. Because of conflicting goals and uncertainty permeate the process of structural modeling, structural model derivation is a complicated process. Therefore, to effectively and efficiently model any structure, one must have a method for planning actions, for proceeding in the face of uncertain information, and for dealing with uncertainty. This paper presents a method for representing structural modeling as a strategic process involving decision-making in an environment where the results of any decision may not be known with complete certainty. Specifically, an existing task-level architecture developed to manage uncertainty in treating cardiac disease is adapted to embody the strategic knowledge of a structural engineer in formulating and solving structural problems. The MUMS system focuses on plates as the structure of interest in its pilot implementation. Since the system is concerned with structural modeling at the strategic level (as opposed to a detailed design, for instance), the ideas presented are applicable to modeling any structure. Keywords: Knowledge based systems. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) This Report describes the successful efforts to computationally model the receptivity of the laminar boundary layer on a semi-infinite flat plate with an elliptic leading edge by a spatial simulation. The compressible flow is simulated by solving the governing full Navier-Stokes equations in general curvilinear coordinates by a finite difference method. First, the steady basic-state solution is obtained in a transient approach using spatially varying time steps. Then, a small-amplitude acoustic disturbances of the freestream velocity are applied as unsteady boundary conditions, and the governing equations are solved time-accurately to evaluate the spatial and temporal developments of the perturbation leading to instability waves (Tollmien-Schlichting waves) in the boundary layer. The effect of leading type radius on receptivity is determined. (jhd)

UNCLASSIFIED REPORT

ABSTRACT: (U) This project employs psychophysical techniques to examine the limitations on spatial vision imposed by the first stages in the visual pathway. Many of the experiments capitalize on laser interferometry, which allows sinusoidal gratings to be formed on an observer's retina that are immune to optical blurring. The appearance of very high frequency gratings to distorted, or aliased, by the cone mosaic. Such moire patterns provide the basis for psychophysical techniques to assess the topography of the cone mosaic in the living eye. These measurements, accompanied by measurements of visual acuity clarify the relationship between cone spacing and resolution. Resolution was also measured under conditions in which only the M or L cones could detect the interference fringe. Visual acuity was little different than it was when both cone types detected the grating, showing that resolution is immune to photoreceptor loss under these circumstances. We also established an aliasing phenomenon caused by spatial sampling by M and L cones. Interferometry also allows measurements of the optical quality of the eye, and a viable experimental design has been established to estimate the off-axis optical quality of the eye.

UNCLASSIFIED REPORT

ABSTRACT: (U) The utilization of high-frequency (HF) radio waves to probe the ionosphere was begun more than 50 years ago when the first swept frequency vertical incidence ionospheric sounder (ionosonde) was developed (see Villard, 1976). A technology evolved, so did the design of ionospheric sounders and several generations of sounders have been developed. As a result, the ionosonde has continued to remain a viable tool for the ionospheric physicist and vast amounts of ionospheric data have been collected. Over the past two decades, with the incorporation of digital technology into ionosondes, more sophisticated ionospheric sounders have been developed, with the capability of measuring the amplitude, phase, angle-of-arrival, polarization and Doppler shift in addition to the time-of-flight (ie. range) of the returned echo (Wright and Fedor, 1969; Reinisch, 1986). These systems have also employed digital recording techniques, markedly simplifying the analysis interpretation of ionograms. Here, details of the NOAA digital ionospheric sounding radar and the Lowell University Digisonde will be discussed briefly as the design concepts are representative of state-of-the-art

UNCLASSIFIED REPORT

ABSTRACT: (U) This project is a collaboration between  
the two named laboratories, extending the capabilities of  
each group. It combines the analytical approach of  
multielectrode recording from many places in the brain  
with comparative approach of seeking clues from lower  
animal species. Using selected paradigms of stimulus  
presentation or omission already known to trigger Event  
Related Potentials (ERPs) in humans, as well as mental  
events, this program compares brain recording from cats,  
reptiles, fish and other lower models, analyzing both  
single trials and averages from many channels.  
Sacrificing the advantage of human subjects easy to  
instruct and to control with respect to attention, we can  
go farther in number of intracranial electrodes in deep  
cerebral and brainstem loci. Early results show that  
lower species have ERPs by the definition of the stimulus  
regime and that much of this response occurs at lower  
brain levels, probably precognitive, suggesting the need  
to distinguish the components in humans that depend on  
cognition from those that do not. New forms of grading  
the expectation of stimuli are being compared on humans,  
cats, and lower species. Keywords: Electroencephalogram,  
Event related potentials, Evoked potentials. (sdw)

ABSTRACT: (U) In experiments in which an intense relativistic electron beam is injected into an evacuated drift tube with a localized gas cloud located near the anode, ions with energies several times the electron beam energy have been observed. These experiments have been simulated using a particle-in-cell code which realistically models ionization of the gas. It was found that when the injected electron beam current exceeds the space-charge limiting current, ions are accelerated to energies several times the electron beam energy by coherent motion of the ions and the intense virtual cathode electric fields. The dependence of the peak ion energy on the system parameters as observed in the simulations is also discussed. For the parameter regimes investigated with beam energies up to 3 MV, beam currents up to 35 kA, gas pressures up to 600 mTorr, and gas cloud widths up to 6 cm, peak ion energies of 5-6 times the electron beam energy have been observed. ABSTRACT: (U) The potential energy, dipole moment, and electronic transition moment curves of the X<sup>2</sup> sigma(+) and A 2 Pi states of the doubly charged CF(++) ion have been calculated from internally contracted multireference CI wave functions with full valence complete active space self-consistent field reference wave functions and large Gaussian basis sets. Both states are predicted to be metastable with equilibrium geometries R sub e (X 2 sigma(+)) = 2.139 Bohr and R sub e (A 2 Pi = 3.073 Bohr. These minima lie above and are separated from their asymptotes by broad barriers with a height of 4.99 eV (X 2 sigma(+)) and 1.04 eV (A 2 Pi), respectively. Similar to the isoelectronic NO(++) , the Pi state intersects the barrier of the X 2 sigma(+) state. Radiative and nonradiative (tunneling) lifetimes of all vibrational levels have been calculated by standard quantum mechanical scattering techniques. Reprints. (jhd)

ABSTRACT: (U) This reprint reviews the traveling wave theory of phase transitions especially as this theory relates to the dynamics of van der Waals like fluids. The paper is divided into three sections after this one. The first section derives the balance laws of mass, momentum, and energy for the one dimensional motion of a viscous, heat conducting fluid possessing a Korteweg-van der Waals contribution to the stress. Also derived are the ordinary differential equations governing the motion of traveling waves. The second section describes some solutions of the traveling wave boundary value problem and their relevance to the phenomena of shock splitting. The third section discusses possible relevance of the traveling wave theory to experiment. (jhd)

SUPPLEMENTARY NOTE: Pub. in Stochastic Processes and their Applications, v33 p73-87 1989.

ABSTRACT: (U) Let  $X(t): t$  an element of  $T$  be a stochastic process equal in distribution to (integral over  $s$  of  $f(t,s)$   $\lambda da(ds)$ ;  $t$  element of  $T$ ), where  $\lambda da$  is a symmetric independently scattered random measure and  $f$  is a suitable deterministic function. It is shown that various properties of the sections  $f(\cdot, s)$  as an element of  $S$ , are inherited by the sample paths of  $X$ , provided  $X$  has no Gaussian component. The analogous statement for Gaussian processes is false. As a main tool, LePage-type series representation is fully developed for symmetric stochastic integral processes and this may be of independent interest. Keywords: Infinitely divisible processes, Sample path properties, Series and stochastic integral representations. Reprints. (JHD)

UNCLASSIFIED REPORT

ABSTRACT: (U) The Joint Services Electronics Program (JSEP) is an important part of the electronics research at the University of California, Berkeley. JSEP is particularly important to the development of new research directions and new faculty investigators. It also provides much needed support for the more basic electronics research. Furthermore, JSEP has encouraged collaborative research involving multiple principal investigators per project. Over the period May 1987 to May 1990 JSEP has supported 20 faculty investigators, 57 students and produced 65 publications in journals or conference proceedings, 14 Ph.D. degrees and 22 M.S. degrees. The research program is organized into two themes: high-speed wide-band elements for high frequency electronics, and new architecture parallel computation. Under the program, several important new phenomena were discovered for highly scaled MOSFETs and the word's fastest room temperature silicon transistor (22ps, fastest for either bipolar or MOS transistors) was fabricated. Nonlinear guided-wave devices such as optical correlator and spectrometer were created. Techniques for achieving tolerance and efficient programming in artificial neural networks were found. The most productive work units of the present program will be

ABSTRACT: (U) This volume contains the proceedings of  
the Symposium of The Electrical, Optical and Magnetic  
Properties of Organic Solid State Materials held at the  
Fall Meeting of the Materials Research Society, November  
27 - December 2, 1989. This was the first MRS symposium  
to address the new and rapidly emerging areas of organic  
solids designed for a broad spectrum of electrical,  
magnetic and optical properties. Most organic compounds  
in the past have been prepared for either their  
structural properties. This could be the dawn of a new  
era in organic materials. (js)

DESCRIPTORS: (U) \*ORGANIC COMPOUNDS, MAGNETIC PROPERTIES,  
MATERIALS, OPTICAL PROPERTIES, ORGANIC MATERIALS,  
SOCIETIES, SOLIDS, STRUCTURAL PROPERTIES, SYMPOSIA,  
TWILIGHT.

IDENTIFIERS: (U) WUAFOSR2303A3, PE61102F.

ABSTRACT: (U) During the period April 89-90, we carried  
out experiments on studies of heteroepitaxial films grown  
on lattice-mismatched substrates in three main areas: (1)  
migration-enhanced (or modulated) MBE to promote 2-  
dimensional growth of heteroepitaxial films, (2) growth  
on patterned substrates to reduce thermal stress, and (3)  
study of GaAs/Si laser characteristics, especially  
polarization dependence and threshold current, to  
correlate with results from basic material studies in  
area 1 and 2. Recently we have started exploring new  
directions for hetero-epitaxy on lattice-mismatched  
substrates, and have done exploratory work on (4) growth  
on (111) plane of strained AlInAs/AlAs quantum well and  
(5) GaAs growth on Si/sapphire (SOI) substrate. In this  
report, we first summarize experimental results on work  
in groups 1, 2 and 3. This followed by a discussion of  
our exploratory work which will point the direction for  
our future research.

DESCRIPTORS: (U) \*FILMS, CONTROL, DENSITY, EPITAXIAL  
GROWTH, GALLIUM ARSENIDES, GROWTH(GENERAL), INTERNAL,  
LASERS, MATERIALS, ORIENTATION/DIRECTION, POLARIZATION,  
SAPPHIRE, STRESSES, SUBSTRATES, THERMAL STRESSES,  
THRESHOLD EFFECTS.

ABSTRACT: (U) Presented is the establishment of a semiconductor optical properties characterization facility constructed at Arizona State University under the sponsorship of an AFOSR-URIP. The fully computerized system is connected to our MBE and electrical properties characterization laboratory network and will be used for two purposes: (1) to study the properties of photonic materials and devices and (2) to study the growth kinetics in solid source and gas source molecular beam epitaxy. As a result of these efforts, a coherent research program has been established that stresses the following points: (1) collaborative research among engineering, physical science and materials science faculty specifically in the field of compound semiconductor (GaAs, AlGaAs, InGaAs and InP based) materials with emphasis on heterojunction and quantum well structures; (2) diagnostics of novel optoelectronic devices and materials; (3) interaction with our strong theoretical efforts to identify new directions MBE growth and optoelectronic DoD programs have been obtained which Several productive DoD programs have been obtained which utilize the equipment for student training and technical publications. The instrumentation has provided a capability for scientific research that is unique in any U.S. university. Thus the training of students of modern instrumentation to effectively pursue present and future

DoD research directions is progressing successfully. (r.h.)

ABSTRACT: (U) The twentieth AMS-SIAM Summer Seminar on applied mathematics was held at Virginia Polytechnic Institute and State University, May 29-June 9, 1989. The topic of the seminar was 'The Mathematics of Random Media'. The purpose of the seminar was to provide an overview of the role of applied probability theory in modeling the properties of materials and processes so complex that they can only be described statistically. Four general topics were selected for study; these were effective medium theory, diffusions and Markov processes, interesting particle systems and waves in random media. The seminar was structured so that each topic received about two and one-half days coverage (roughly 12 or 13 hourly presentations). One or two of the hourly talks at the beginning of each segment were aimed at providing general background and orientation for the audience. Keywords: Symposia, Mathematical models, Applied mathematics, Theory. (CP)

UNCLASSIFIED REPORT

ABSTRACT: (U) Four additional batches of polyethylene (PE)-supported palladium catalyst were prepared. These catalysts have been evaluated for the preparation of a diynol addition product 2 starting from 4,4-bis(3-bromophenoxy) diphenyl sulfone 1 (Figure 1). Palladium still leaches into the product. The reaction conditions of palladium complexation with triphenyl phosphine (TPP) were studied. The optimum amount of TPP required in the diynol addition reaction was lowered to a range of one-half as compared to the established procedures. Under the Biotech-Support part of this program, reaction conditions favoring condensation of phenols and aromatic halides were explored using model reactions of m-cresol and dichlorodiphenyl sulfone and difluorobenzophenone. Condensation reactions were faster in the presence of 18-Crown-6 than CsI. Difluorobenzophenone reacted faster than dischlorodiphenyl sulfone with m-cresol. The reaction conditions were applied to the condensation of m-hydroxyphenyl acetylene and aromatic dihalides. (js)

UNCLASSIFIED REPORT

ABSTRACT: (U) Research and documented works on Viscous hypersonic flow theory are summarized and reported. Topic areas where the research has been focused are: (1) a fully viscous version of the shock layer (VSL) and its extension beyond the Navier-Stokes (NS) level based on Grad's thirteen moment equations (2) INVISCID-VISCOUS iteration in hypersonic flows. The development in area 1 has led to a principle which allows correlation of shock layer flow far from translational equilibrium with a corresponding flow based on the NS equations, as substantiated by extensive comparison of direct simulation Monte Carlo and NS-based calculations. The development in area 2 resulted in a triple-deck theory of hypersonic boundary layer under strong wall cooling which exhibits drastically different structure and properties of the triple-deck. (edc)

## UNCLASSIFIED REPORT

ABSTRACT: (U) This paper introduces the mixed finite element method as a viable numerical procedure for the boundary controllability of the linear wave equation. Another numerical implementation using Galerkin finite elements has been investigated. However, due to approximation problems of the normal derivative on the boundary, the method becomes unstable as the mesh is refined. To correct for the ill-posedness of the approximate problem, a Tychonoff regularization method was implemented. The aforementioned paper also presents other possible remedies; among them is the mixed finite element method. The fixed finite element approximation is a plausible procedure to overcome these difficulties since the derivative at certain nodal values arises naturally from the formulation. (jhd)

ABSTRACT: (U) This program constructed and demonstrated an apparatus for the development of laser diagnostics for the gas phase molecules involved in semiconductor fabrication techniques, particularly the organometallic chemical vapor deposition of compound semiconductors like gallium arsenide. Work in this apparatus, a flow tube with mirrors for long path tunable infrared diode laser absorption and electrodes for a radio frequency glow discharge, culminated in observations designed to assess the importance of arsenic hydride radicals in the decomposition of organoarsenic compounds. Preliminary observations of fluorocarbon and methane plasmas produced observations of several species which could be compared with models and other observations and which added to knowledge of these systems with their important applications in silicon etching and diamond deposition. The program also resulted in band strength measurements for the methyl and difluorocarbene radicals, using tunable diode laser, dye laser, and fast flow reactor techniques. (R.R.H.)

ABSTRACT: (U) The objectives of this program are to characterize the interfacial region in a variety of whisker and coated fiber reinforced glass ceramic matrix composites, and to study how the structure, chemistry, and bonding characteristics of the interface influence composite properties such as strength, toughness, and environmental and thermal stability. During the past year, efforts in the whisker composite area were focused on the investigation of whisker coatings such as carbon and BN on LAS glass ceramic matrix composite properties, fabrication and characterization of calcium aluminosilicate (CAS) matrix/SiC whisker composites, high resolution TEM studies of a variety of techniques, and the evaluation of SiC platelets as an alternate reinforcement to whiskers. Efforts in the coated fiber area were focused on the evaluation of yttria and BN coated NICALON fibers from General Atomics. Results of these studies are presented. Keywords: Ceramic composite interfaces, Whisker reinforced glass ceramics, LAS matrix SiC whisker composites, Coated fiber, Glass ceramic composites. (js)

ABSTRACT: (U) Listeners use language-specific knowledge to impose perceptual structure on speech. Since this knowledge must be learned through linguistic experience, data on the development of speech perception could constrain theories of adult speech perception. This workshop focused on the transitions in the perceptual processing of speech from infancy to adulthood. The workshop consisted of nine presentations over a two-day period in June, 1989. Several researchers argued that dynamic mechanisms are critical for relating the acquisition and use of linguistic of learning and attention were targeted as being critical to the development of speech perception. Further, since listeners appear to use information from several levels of linguistic analysis and to cross-correlate knowledge about perception and production, a complete theory of spoken language understanding must address how different forms of linguistic knowledge are related in perceptual processing. Keywords: Speech perception, Perceptual development, Spoken language, Auditory perception, Word recognition, Phonetics. (js)

UNCLASSIFIED REPORT

UNCLASSIFIED REPORT

ABSTRACT: (U) The Hoelder continuity of sample paths of the following classes of stochastic processes is examined:

- (1) Processes satisfying Kolmogorov's moment condition,
- (2) self-similar stable processes with stationary increments and
- (3) harmonizable fractional processes.

ABSTRACT: (U) This work focused on instability, routes to chaos, and transition to turbulence in an axisymmetric jet. The research focused on three basic tasks. The first involved the search for evidence of low dimensional strange attractors in a naturally excited condition. The theoretical analog was the construction of low-dimensional model equations for this flow. The second involved 3-D (non-axisymmetric) periodic forcing of the jet to lead to the enhanced growth of 3-D modes. This was to focus on natural resonant mechanisms involving natural instability modes of the shear layer and jet core. The theoretical analysis for this part was to predict the conditions for the most resonant interactions, which would maximize our ability to control the jet outcome. The third task was to integrate the previous tasks to exploit important mode interactions which lead to strong nonlinear regimes and or random or chaotic states. In this phase, we accomplished this through intrinsic forcing of the jet by 'enhanced feedback'. The results of the work have covered all these tasks, and yielded many new fundamental results basic to dynamical systems with feedback.

ABSTRACT: (U) We have prepared several totally aliphatic polycarbonate blocks and measured their glass transition temperatures and melting points. We have performed differential scanning calorimetry (DSC) to test the ability of these polymers to endothermically decompose in the presence of acid and/or heat. We have linked these blocks to give us an aliphatic polycarbonate ABA block copolymer. We have prepared several poly(orthoformate) polymers, which endothermically decompose in the presence of acid. We have prepared ABA block copolymers using poly(orthoformates) and BAMO as the blocks and studied their LOVA properties. We have devised a simple, economical approach to the synthesis of polynitramine binders over those taken previously. Keywords: Propellants, Low vulnerability explosives, Polycarbonates, Polynitramines, Explosives. (jes)

UNCLASSIFIED REPORT

ABSTRACT: (U) The problem of estimating the integral of a stochastic process by linear estimators based on observations of the process and its existing quadratic mean (q.m.) derivatives at a finite number of sampling points is considered. The process is assumed to have exactly  $K$  q.m. derivatives,  $K=0, 1, 2, \dots$ . The asymptotic performance of optimal-coefficient estimators that depend on an inverse matrix is determined for regular sampling designs under slightly different assumptions than those in Sacks and Ylvisaker (1970). Simple-coefficient estimators based on a trapezoidal rule with a correction term that depends on the q.m. derivatives of the process at all sampling points of a regular design are introduced. Their asymptotic performance is identical to that of the optimal-coefficient estimators. Keywords: Linear equations, Stochastic processes, Integrals. (cp)

ABSTRACT: (U) The criterion, obtained by Gaposhkin, for a (weakly) stationary process to satisfy the strong law of large numbers (SLLN) has had various extensions, in particular to second order non-stationary harmonizable processes. Outside of the  $L$  squared-framework, it has also been studied for Fourier transforms of independently scattered symmetric alpha-stable ( $S$  alpha  $S$ ) measures. It is shown here that via this spectral approach, neither the  $L$  squared - requirement nor any distributional assumption are indispensable in establishing the SLLN. Only the harmonic representation with respect to a bounded (in a sense to be made precise) random measure is crucial. This is illustrated in this work, where we obtain conditions for the SLLN to hold for some classes of processes with finite alpha sub th-moment, which, in addition, are Fourier transforms. It is well known that stationary processes and unitary groups of operators are interchangeable, and so are the corresponding strong law and pointwise ergodic theorem. This type of duality between operators and processes carries over to our framework, although in general, the operators are not shifts. It is thus, also the purpose of our work to obtain the pointwise ergodic theorem, for some new

ABSTRACT: (U) Let  $\mu$  be a  $\alpha$ -finite Borel measure on a separable metric space  $T$ , and let  $(X(t), t \in T)$  be a measurable  $\alpha$ -stable process,  $0 < \alpha < 2$ . Sample path integrals of a certain type arise in many situations, e.g. in multiple stochastic stable integration (Rosinski and Woyczynski 1987), in inversion formulae for the Fourier transform of stable noise (Cambanis 1988), in integral transformations between stationary and stationary increments stable processes (Cambanis and Maejima 1990) and others. It is important, therefore, to know exactly when the above integral is finite. Although much is known about this question, certain things appear to have been unknown in the case  $p < 1$  and even the known results are scattered in the literature and have never been put together, mainly because different cases have been handled using very different tools, varying from path order analysis to geometry of certain Banach spaces. As a result, researchers working with stable processes have had to justify in each case existence of sample path integrals (see Cambanis and Maejima (1990) for a recent example). It is our purpose in this paper, therefore, to give necessary and sufficient conditions for sample path integrability of stable processes in the case which has been to use form. (KR)

ABSTRACT: (U) As part of an ongoing study of the thermal reactions of iron carbonyls with 7-substituted norbornadienes (Marchand & Hayes, 1977; Marchand, Earlywine & Heeg, 1986), the reactions of Fe(CO)5 and of Fe2(CO)9 with 7-(p-cyanophenoxy)norbornadiene (1) were investigated. Compound (1) was synthesized via palladium(II)-promoted valence isomerization (Patrick & Bechtold, 1984) of 3-(p-cyanophenoxy)quadracylane. Thermal reaction with Fe(CO)5, performed in refluxing di-n-butyl ether, resulted primarily in alkyl-oxygen cleavage in the substrate, thereby affording p-cyanophenol in 23% yield. The corresponding reaction with Fe2(CO)9, performed in refluxing benzene, afforded unreacted (56%), a cage dimer (2.9%), and a dimer ketone (6.2%). Reprints. (jes)

ABSTRACT: (U) A one-color photolysis/ionization study of the photodissociation of hydrazoic acid near 283 nm has been carried out. The N2 and NH products have both been detected in a state-specific manner by resonance-enhanced multiphoton ionization (REMPI) in a time-of-flight mass spectrometer. The N2 fragments were observed in the v=0 vibrational manifold and were found to be highly rotationally excited, with an average rotational excitation of 0.79 ev. The correlation parameter for N2 was determined to be positive and approximately equal to 0.5, indicating that the angular momentum vector J tends to be parallel with the transition dipole. Relatively little rotational energy was found in the NH product. Keywords: Photolysis, Laser ionization, Hydrazoic acid. (jes)

ABSTRACT: (U) Titanium-doped reductive coupling of D3-trishomocubano-affords meso- and dl-D3-trishomocubylidene-D3-trishomocubane (2a and 2b, 60%) and D3-trishomocubanol (3, 25%). The structures of 2a and 2b were elucidated by X-ray crystallographic methods. Reaction of a ca. 1:1 mixture of 2a and 2b with a chloroform solution of trifluoroacetic acid at room temperature for 2.5 h afforded the corresponding 1,2-adduct (4b, 39%) along with isomerically pure, unreacted 2a (46%). The corresponding reaction of 2a, when performed at reflux for 48 h, afforded an extensively rearranged spirocyclic trifluoroacetate adduct, 4a (30%), along with recovered 2a (40%). The structure of 4a was established via X-ray crystallographic analysis of the corresponding alcohol, 5, that resulted via lithium aluminum hydride reduction of 4a. Electrophilic bromination of 2b with Br<sub>2</sub>-CCl<sub>4</sub> solution proceeded smoothly at room temperature to produce the corresponding 1,2-adduct, 9 (80%), whose structure was established unambiguously by X-ray crystallography. Keywords: Titanium reductive coupling, Trishomocubane, Electrophilic addition, Alkenes. (jes)

ABSTRACT: (U) The utility of silicon compounds in  
synthetic organic chemistry has long been recognized.  
Silicon's low electronegativity, its ability to expand  
its coordination sphere, and its strong bonds to  
electronegative elements allow it to serve in a variety  
of roles in the reactions of organic compounds. Silyl  
substituents can be employed to direct the course of  
reactions, to activate substrates, or to protect  
otherwise reactive sites in molecules. More recently,  
creative applications of silyl groups in the  
chemistry of organometallic inorganic complexes have  
begun to appear, from the synthesis of reactive metal  
hydroxymethyl compounds via the (trimethylsiloxy) methyl  
ligand to the substitution of sulfido for oxo ligands at  
metal centers using hexamethyldisilthiane. Organic,

ABSTRACT: (U) When data comes from a distribution belonging to the domain of attraction of a stable law, Athreya (1987a) showed that the bootstrapped sample mean has random limiting distribution, implying that the naive bootstrap could fail in the heavy-tailed case. The goal here is to classify all possible limiting distributions of the bootstrapped sample mean when the sample comes from a distribution with infinite variance, allowing the broadest possible setting for the (nonrandom) scaling, the resample size, and the mode of convergence (in law). The limiting distributions turn out to be infinitely divisible with possibly random Levy measure, depending on the resample size. An averaged-bootstrap algorithm is then introduced which eliminates any randomness in the limiting distribution. Finally, it is shown that (on the average) the limiting distribution in the domain of (partial) attraction of a stable law. (Author) (kr)

UNCLASSIFIED REPORT

ABSTRACT: (U) The mode I and II delamination of multi-directional composite laminates have been studied using a J-integral approach. The analytical and experimental formalism to apply the J-integral to delamination have been developed and verified on three different composite material systems with matrix toughness varying from very brittle to very tough. Large deflections and rotations, midplane straining and distributed damage are taken into account in the methodology. The experimental conditions under which a path independent J may be measured have been established. The effect of several variables including specimen geometry, stacking sequence, and material constitutive behavior on the J-Moment-at-the-crack-tip relationship have been determined. Multidirectional composite laminates are both more susceptible to far field damage in the off-axis plies and less stiff than unidirectional layups. These two factors cause a greater tendency to geometric and material nonlinearity in delamination testing. The use of a traditional G approach to characterize fracture behavior

ABSTRACT: (U) Our investigation of defect interactions and properties related to seminsulating behavior of III-V semiconductors resulted in about twenty original publications, six doctoral thesis, one masters thesis and numerous conference presentations. The studies of new compensation mechanisms involving transition metal impurities have defined direct effects associated with deep donor/acceptor levels acting as compensating centers. Electrical and optical properties of vanadium and titanium levels were determined in GaAs, InP and also in ternary compounds InGaAs. The experimental data provided basis for the verification of chemical trends and the VRBE method. They also defined compositional range for III-V mixed crystals whereby seminsulating behavior can be achieved using transition elements deep levels and a suitable codoping with shallow donor/acceptor impurities. ## UNCLASSIFIED REPORT

ABSTRACT: (U) The Research Proposal Quarterly Status Report lists all the research proposals received by AFOSR in the previous six months along with the action taken (Initiated, Declined or Withdrawn) on each report. The report is divided into two parts. The Institution index lists proposals alphabetically by institution. This is followed by a more detailed listing by Directorate, and by Program Manager within the Directorate. This report is designed to inform other Government sponsoring agencies of the proposals received by the AFOSR and the action taken on these proposals. Readers must keep in mind that declined proposals should not necessarily be considered as scientifically unacceptable; many declinations result from a lack of funds or as a result of special programmatic emphasis.

DESCRIPTORS: (U) \*RESEARCH MANAGEMENT, AIR FORCE

SUPPLEMENTARY NOTE: See also abstracts of contributed  
papers, AD-A163 497.

ABSTRACT: (U) Symposia on topics of strong current interest included Dynamics of Photo- and Electron-Capture Dissociation, Energy Transfer Processes Involving Polarized Atom Collisions, State Resolved Capture by Multicharged Ions, and Multiphoton Ionization. New techniques and applications also continue to be developed that provide vitality and new directions to the field. For example, the recent progress on the laser cooling of atoms and its possible application to collision physics was described as well as progress in producing beams of low energy positrons and polarized electrons. The scope of the conference has broadened in a natural way as the field has progressed, the problems of interest have changed, and the tools at our disposal have improved. This evolution was particularly evident at this conference from the increased attention being given to the role of exit channel spectroscopy and decay processes in all types of collisions whether they were excited with ions, electrons, or photons. It is exemplified by the photo excitation processes in which it is possible to prepare well-specified systems on which to conduct half-collision experiments. Thus, the exit channels of many types of collision processes, such as autoionization, dissociation, and detachment, are being investigated on a

ABSTRACT: (U) This final report consists of ten sections. The first is a report describing our abilities in the co-site radio frequency interference (RFI) problem. The second is the paper Heisenberg Wavelets and the Uncertainty Principle, which will be expanded upon and submitted to the appropriate technical journal. The third is a revised version of the paper A Multidimensional Wiener-Wintner Theorem and Spectrum Estimation, which will appear shortly in the Transactions of the American Mathematical Society. The fourth is the expository paper Problems on Polynomials with Restricted Coefficients Arising from Questions in Antenna Theory, to appear shortly in the Proceedings of the 1989 NATO Advanced Study Institute on Fourier Analysis and its Applications. The fifth is the paper An Ideal Omnidirectional Transmitting Array, and Optimal Peak Factor Array, for Less Than Half-wavelength Spacing, to be submitted shortly to the IEEE Transactions on Antennas and Propagation. The sixth is the revised paper Properties on the Unit Circle of Polynomials with Unimodular Coefficients, which just appeared in the Proceedings of the American Mathematical Society. The seventh gives an overview of awd, which is our new method of choosing shading coefficients, based on a convex programming approach. The eighth is the latest revision of the paper A

UNCLASSIFIED REPORT

ABSTRACT: (U) Recently derived necessary conditions, and related sufficient conditions, suggest that adaptive control can be used for systems having nonlinear and/or flexible, potentially extending adaptive control far beyond the existing scenarios. This report documents research in adaptive stabilization of certain infinite dimensional linear systems in state space form and an extension to the stabilization and control of distributed parameter systems, modelled as boundary value systems, using point actuators and sensors. Research on nonlinear stabilization and control is also described leading to the formulation and partial solution of feedback stabilization about attractors as both an important extension of classical equilibrium analysis and as an important tool in more sophisticated control tasks such as asymptotic tracking and disturbance rejection. Keywords: Adaptive control, Stabilization, Dynamic compensation, Nonlinear control. (Author) (kr)

## UNCLASSIFIED REPORT

ABSTRACT: (U) The primary research objective of this project was to investigate the possibilities of improved performance in the 'standard' GaAs field effect transistor structures. A secondary objective was to determine the extent to which Deep UV Lithography could be used as a technique to produce high resolution geometries. At this point in time we have succeeded in the second endeavor and can now routinely produce 0.5 micron gate geometries with Deep UV lithography and occasionally we have produced sub 0.25 micron structures. Using this technology we have produced devices with 'state of the art' electrical characteristics. Toward the end of this reporting period and into the last term of the contract we are investigating a novel structure to try and increase the output conductance of our devices. As an aside we have investigated the annealing of undoped epitaxial material and have obtained some interesting results which are the subject of our first Phd. thesis. (rh)

UNCLASSIFIED REPORT

ABSTRACT: (U) Functional and mechanistic comparisons are made between several networks models of cognitive processing: competitive learning, Interactive activation, adaptive resonance, and back propagation. The starting point of this comparison is the article of Rumelhart and Zipser (1985) on feature discovery through competitive learning. All the models which Rumelhart and Zipser (1985) have described were shown in Grossberg (1976b) to exhibit a type of learning which is temporally unstable. Competitive learning mechanisms can be stabilized in response to an arbitrary input environment by being supplemented with mechanisms for learning top-down expectancies, or templates; for matching bottom-up input patterns with the top-down expectancies; and for releasing orienting reactions in a mismatch situation, thereby updating short-term memory and searching for another internal representation. Network architectures which embody all of these mechanisms were called adaptive resonance models by Grossberg (1976c). (JES)

ABSTRACT: (U) The 1989 Biennial Inorganic Symposium with the theme Inorganic Compounds with Unusual Properties. III. Electron Transfer in Biology and the Solid State was held at the University of Georgia in Athens, Georgia, during the period March 1-4, 1989. The symposium stimulated interactions between scientists studying mechanisms of electron transfer between metal centers in solid state materials and those studying the same process in metalloproteins. The program consisted of 17 invited talks, 10 contributed oral presentations, and 21 poster presentations. A book containing papers for 23 of the 27 oral presentations is being published by the American Chemical Society as an Advances in Chemistry Series volume. Lists of the symposium participants and titles of both the oral presentations and posters presentations are appended to this report. Superconductivity. Metalloenzymes, Electron transfer. (KR)

ABSTRACT: (U) The goal of this project was to develop fast algorithms for performing the computations required by the various early vision modules that we have been developing. The early vision modules require intensive computation and are a major problem in system development since they consume a distractingly large amount of real time during the development process. The goal of the work therefore was high computational efficiency, to be accomplished both by improving the basic efficiency of the algorithms as well as multiprocessing, so that the development of larger systems that use the early vision modulus as components would not be adversely affected by slow response times of the modules. ABSTRACT: (U) This project was for continuation of research to investigate the molecular mode of action of a membrane-active hydrocarbon, toluene, potentially present in the Air Force environment as a flight fuel component or from other sources and to serve as a model for other membrane-active molecules in the environment. Two important target sites were identified where rapid dose-dependent but reversible changes in the membrane organization occurred at low dose levels. One of these was at the plasma membrane where the ability of the membrane to form protuberances was severely compromised. The other concerned a failure to form protuberances by membranes involved in internal trafficking between the endoplasmic reticulum and the Golgi apparatus. This step was reproduced in a cell-free system making detailed studies possible. The toluene inhibited step was identified as dependent on ATP hydrolysis. The involved ATPase activity was characterized, solubilized and partially purified. (jes)

ABSTRACT: (U) Models of human lightness and color perception must take account of color constancy, a tendency for apparent surface color to be relatively independent of the color and intensity of the illuminating light source. Our observers matched the lightness (apparent reflectances) and brightnesses (apparent luminances) of regions in simple and complex achromatic spatial patterns. The data showed that the observers' knowledge of the surface reflectances was unaffected by brightness changes due to varying illuminance. A third perceptual dimension, local brightness contrast, was different from both lightness and brightness. In further experiments we found that moving a patch from a black background to a white background could produce an error of apparent surface color of about 1.5 Munsell Value steps. Similar experiments at mesopic mean luminances revealed that the brightness contrast produced by a fixed luminance contrast declines with mean luminance. Keywords: Visual illusions; Color constancy; Color vision. (edc)

ABSTRACT: (U) Low levels of lipophilic organochlorine compounds (OCs) are present in the environment. Despite the fact that there is no question regarding the toxicity of many of these compounds on an acute high dose basis, the chronic effects of low levels of these materials has not been adequately examined. Since the chemical properties of these materials make them incompatible with water, the cell must use specialized means for handling them. These include xenobiotic metabolizing enzymes, cytosolic binding proteins and lipid storage depots. The studies performed during the period of this grant were an attempt to characterize a pretreatment disposition response (PDR) system which is a portion of the cellular response to low levels of OCs. It is apparent from our studies that PDR is not due to changes in the total lipid content of cells but may be due to an alteration in cytosolic binding proteins. (jes)

MONITOR: AFOSR  
TR-90-0832

UNCLASSIFIED REPORT

ABSTRACT: (U) The obvious benefits of the design of aerospace structures using lighter materials with high specific strengths and stiffnesses had led to the development of numerous reinforced composite metallic and intermetallic materials, which have become serious commercial competitors to traditional monolithic metallic alloys. While significant advances in processing technology have made the fabrication of such hybrid materials more of an economic reality, their widespread use in airframes or other structures has been limited by serious deficiencies in mechanical properties, particularly ductility, toughness and fatigue. This problem is compounded by the lack of fundamental studies which provide a rational basis for the underlying sources of crack-propagation resistance, and in particular which define the critical role of composite microstructure. Keywords: Fatigue; Fracture toughness; Subcritical crack growth; Metal-matrix composites; Laminates; Fatigue cracks; Crack closure; Crack bridging; Aluminum alloys; Titanium alloys. (JES)

ABSTRACT: (U) The Fischer-Tropsch (F-T) reaction, the conversion of synthesis gas (CO/H2) to hydrocarbons and oxygenates, has commanded the attention of the organometallic community for the past 10-15 years. During periods when olefin feedstocks are costly, the production of low molecular weight commodity chemical from coal or natural gas via this method becomes economically attractive. The heterogeneously catalyzed F-T process is inherently nonselective since it produces a Schulz-Flory distribution of hydrocarbons, oxygenates, or both; thus homogeneous systems, considered to possess the advantage of greater selectivity have attracted substantial interest. While a commercially feasible homogeneous F-T process has yet to be developed, some of the desired selectivity, especially toward methanol and C2 oxygenates, has been demonstrated. In addition, organometallic chemistry, through investigations of stoichiometric transformations involving carbon monoxide and dihydrogen, has dramatically increased our fundamental understanding of plausible individual steps that pertain to the F-T reaction. UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Includes nine attachments.

ABSTRACT: (U) The purpose of our research has been to delineate mechanisms of neuronal communication in the mammalian brain. We have studied rapid mechanisms of communication, including electrical transmission and chemical synapses, with an emphasis on local interactions among cortical and hypothalamic neurons. In the hippocampus, we are completing our studies concerning the effects of altered osmolality of the extracellular fluid on synchronous bursting of population spikes in low-Ca<sup>2+</sup> solutions (chemical synapses blocked). Electrophysiological studies on hypothalamic neurons have primarily evaluated the role of excitatory amino acids in fast synaptic transmission in the supraoptic, paraventricular and suprachiasmatic nuclei. Intracellular recordings have allowed direct analyses of EPSPs, and single-electrode voltage-clamp experiments have permitted analyses of synaptic currents. These experiments have provided direct evidence that glutamate is the primary fast excitatory transmitter throughout the hypothalamus. Keywords: Electrical interactions, Hippocampus, Hypothalamus, suprachiasmatic nucleus, Excitatory amino acids. (JES)

ABSTRACT: (U) Properties of highly stripped ions have been computed relativistically in intermediate coupling with configuration interaction, including quantum electrodynamic effects. Charged-particle ionization cross sections have been calculated, including effect of autoionizing resonances on electron-impact excitation rates. Dielectronic recombination rates have been calculated. An extensive computation of relativistic Auger radial matrix elements has been performed; the results can be used to calculate radiationless transition rates in multiply ionized atoms and are expected to be very useful for the computation of Auger rates in molecules. ABSTRACT: (U) A continuum theory for laminated composite materials, referred to as 'Cosserat Composite Theory', was developed. The theory was represented by a set of well defined conservation laws that within the context of purely mechanical theory exhibits the following features: (i) it accounts for the effect of microstructures, (ii) it accounts for the effect of geometric nonlinearity, (iii) it accounts for the interlaminar stresses and therefore delamination can be considered, (iv) it is capable of incorporating the effect of material nonlinearity, (v) it accounts for the effect of curvature, (vi) it possesses a continuum character, and finally (vii) it is applicable to both static and dynamic problems. The composite laminate was modeled as a series of Cosserat surfaces which were considered as microstructures. Various quantities associated with the microstructure were defined and the corresponding quantities for composite laminates were derived. The nonlinear constitutive equations for an elastic composite laminate were presented. (JES)

ABSTRACT: (U) These studies concern the chiral reactivity of AChE, and examine the topography of the enzyme subunit. Several independent kinetic and equilibrium indices of ligand orientation are employed: bimolecular inhibition, oxime reactivation, aging, and equilibrium dissociation constants. Organic synthesis is an integral part of these studies and we developed several families of achiral and chiral, and fluorescent and non-fluorescent organophosphonates and reversible noncovalent fluorescent probes. These agents are employed in study of AChE from Torpedo, as one means for probing subunit topography, as well as in vivo and in vitro studies concerning cellular regulation of AChE. Keywords: Acetylcholinesterase; Organophosphates; Organophosphonates; Chirality; Cellular toxicity. (jes)

ABSTRACT: (U) The purpose of this grant was the  
acquisition of an X-ray diffractometer system for use in  
evaluating the heteroepitaxial growth of III-V  
semiconductor compounds and alloys. The diffraction data  
permit a determination of the lattice constant mismatch  
between the single crystal substrate and the epilayer.  
Keywords: Semiconductors, X-Ray diffraction, Epitaxial  
growth. (cp)

ABSTRACT: (U) Dispersion-toughened ceramics have  
received much attention in recent years due to their  
impressive mechanical properties. In particular, ZrO<sub>2</sub>  
additions to Al<sub>2</sub>O<sub>3</sub> can increase the strength of the  
material to greater than 1 GPa. Typically, small amounts  
of ZrO<sub>2</sub> (< or = 30 vol. %) are dispersed in a fine-  
grained Al<sub>2</sub>O<sub>3</sub> matrix; the ZrO<sub>2</sub> exists as both  
intragranular and intergranular, incoherent particles  
with either monoclinic (m) or tetragonal (t) symmetry.  
The enhanced strength and toughness arise from the  
phenomenon known as transformation toughening, involving  
the martensitic t-ZrO<sub>2</sub> to m-ZrO<sub>2</sub> transformation.  
Nucleation of the transformation invariably occurs at the  
ZrO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub> interface. High resolution electron microscopy  
contributes vital information in helping to understand  
these interfaces. In the past, HREM has been performed on  
materials of known orientation containing coherent or  
semicoherent interfaces. In polycrystalline ZrO<sub>2</sub>-  
toughened Al<sub>2</sub>O<sub>3</sub> (ZTA), the ZrO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub> interface is not  
only incoherent but the particle and matrix are of random  
orientation. In spite of these adverse conditions, HREM  
is still possible, and yields interesting results.

ABSTRACT: (U) Because of its unusual mechanical and electrolytic properties, zirconia (ZrO<sub>2</sub>) finds a wide variety of uses, such as refractories, oxygen sensors, heaters and extrusion dies. ZrO<sub>2</sub> exists in three polymorphic forms; the high temperature phase is cubic and is isostructural with CaF<sub>2</sub> (fluorite); below 2350 C (in pure ZrO<sub>2</sub>), a tetragonally-distorted version of the fluorite structure exists. At still lower temperature, the tetragonal form (t-ZrO) transforms martensitically to a monoclinic structure (m-ZrO<sub>2</sub>). This transformation gives rise to the phenomenon of transformation toughening in ZrO<sub>2</sub>-containing ceramics, and thus provides ceramics with potential for high technology structural applications. ABSTRACT: (U) The equipment purchased on this grant is being used for on-line experimental control, data collection and data analysis on studies of the adaptive rules used by mammalian brain cells during conditioned behaviors. The research is based on the assumption that human intelligence has evolved from the goal-seeking brain functions of lower forms, and that these functions in turn depend on a capacity for behavior to be strengthened or rewarded by its consequences (positive reinforcement). We furthermore assume that positive reinforcement of the intact organism is physiologically mediated at the level of the single neuron, rather than at the level of the multi-neuronal assembly or network. (SDU)

DESCRIPTORS: (U) \*INTELLIGENCE(HUMANS), ADAPTIVE SYSTEMS, BEHAVIOR, BRAIN, CELLS(BIOLOGY), CONTROL, DATA ACQUISITION, DATA PROCESSING, FUNCTIONS, MAMMALS, NERVE CELLS, ONLINE SYSTEMS.

ABSTRACT: (U) The funds provided by grant number AFOSR-83-0315 were combined with matching funds provided by the University of Texas to create a hardware and software development environment for parallel computer systems. The hardware development environment includes a chip and printed circuit board design and simulation capability and a high performance digital logic analyzer. The software development environment is a software-rich superminicomputer and a set of low-power graphics workstations. The total configuration includes a Digital Equipment Corporation VAX 11/750 computer system including the VMS operating system and a complement of other software, a Valid Logic computer-aided-design workstation including the Scald design system, a Tektronix DAS9129 high performance digital logic analyzer and a set of Apple Macintosh microcomputers to be used for terminals and as low-powered workstations. The fabrication of and the selections for the printed circuit boards for the four-processor nine-memory configuration of the Texas Reconfigurable Array Computer (TRAC) were also funded from this grant. There was one change between the equipment complement proposed and that actually purchased. The functions of the hardware documentation system specified in the proposal were subsumed in the capabilities of the Valid Logic design system purchased with matching funds from the University of Texas.

UNCLASSIFIED REPORT

ABSTRACT: (U) The work described here is part of an ongoing set of studies aimed at characterizing the physiological actions and anatomical organization of the monoaminergic projection systems to the rat cerebral cortex. The underlying theme of this work is that the endogenous monoamines, norepinephrine (NE) and serotonin (5-HT), serve to modulate central neuronal responsiveness to afferent synaptic inputs and by so doing participate in the cognitive process of selective attention. Individual studies conducted during the past year have investigated: (1) the adrenergic and amino acid receptor specificity of NE-induced facilitation of glutamate efficacy, (2) the influence of NE on GABA-induced membrane conductance changes in identified cortical neurons, (3) the effects of NE on the receptive field properties of visual cortical neurons and (4) the anatomical distribution of monoamine-containing cells that project via axon collaterals to multiple sites along the central somatosensory pathway. Overall, the data provide further support for the contention that the diffusely distributed monoamine systems of the mammalian brain may enhance the performance of target neuronal circuits as a function of changing behavioral conditions. ABSTRACT: (U) During this 18 month short term initiative grant we have developed a new state of the art ERP laboratory based on Macintosh computers and labview software that can record up to 64 channels of EEG input. In this report we describe this system, its potential and include a manual for its operation. In addition, we have completed two experiments that show a distinction between words and consonant strings that is maximal for occipital lobe electrodes and that occurs within the first 250 millisecond after input. In addition, words also differ from consonant strings in the lateral distribution of electrical activity over posterior temporal leads within the first 200 millisecond following input. These two results conform to findings using PET suggesting an area sensitive to orthographic regularity in the left ventral occipital lobe (Snyder et al, 1989). Keywords: Attention, Event related potentials, Parallel distribution processes, Work recognition. (JES)

SUPPLEMENTARY NOTE: Pub. in SIAM Jnl. on Numerical Analysis, v27 n3 p656-694 Jun 90.

SUPPLEMENTARY NOTE: Pub. in Symposium Proceedings of the Materials Research Society, v134, Boston, MA, November 28-December 2, 1988.

ABSTRACT: (U) The Symposium on The Materials Science and Engineering of Rigid-Rod Polymers was held from November 28 to December 2, 1988, in Boston Massachusetts, as Symposium J of the 1988 Fall Meeting of the Materials Research Society. It provided the first international forum for a comprehensive, multidisciplinary discussion of the science and engineering of rigid-rod polymers and molecular composites. These new materials represent an outstanding scientific development and have considerable potential for technological applications ranging from structural to electronic and nonlinear optical. (JES)

DESCRIPTORS: (U) \*COMPOSITE MATERIALS. \*ELASTOMERS. INTERNATIONAL. MASSACHUSETTS. MATERIALS. MOLECULES. SOCIETIES. SYMPOSIA.

ABSTRACT: (U) Consider the large systems of linear equations  $A \text{ sub } h \text{ u sub } h = f \text{ sub } h$  that arise from the discretization of a second-order elliptic boundary-value problem. Consider also the preconditioned systems  $(I) (1/B \text{ sub } h) A \text{ sub } h \text{ u sub } h = (1/B \text{ sub } h) f \text{ sub } h$  and  $(II) A \text{ sub } h (1/B \text{ sub } h) v \text{ sub } h = f \text{ sub } h$ ,  $u \text{ sub } h = (1/B \text{ sub } h) v \text{ sub } h$ , where  $(1/B \text{ sub } h)$  is itself a matrix that arises from the discretization of another elliptic operator. The effect of boundary conditions (of A and B) on the L2 and H1 condition of  $(1/B \text{ sub } h)$ , A sub h, A sub h,  $(1/B \text{ sub } h)$  is discussed. In particular, in the case of H2 regularity, it is found that  $\text{Abs val } (1/B \text{ sub } h)(A \text{ sub } h) \text{ sub } L2$  is uniformly bounded if and only if A\* and B\* have the same boundary conditions, whereas  $\text{Abs val } (A \text{ sub } h)(1/B \text{ sub } h) \text{ sub } L2$  is uniformly bounded if and only if A and B have the same boundary conditions. Similarly,  $\text{Abs val } (1/B \text{ sub } h)(A \text{ sub } h) \text{ sub } H1$  is uniformly bounded if and only if A and B have homogeneous Dirichlet boundary conditions on the same portion of the boundary. This latter result does not depend on H2 regularity. Reprints. (jhd)

UNCLASSIFIED REPORT

ABSTRACT: (U) A new theoretical description of mean chemical reaction rates in premixed turbulent combustion is devised. The mean rate is described as the product of the number of flamelet crossings per unit time and the average chemical production per crossing. Chemical mechanisms of arbitrary complexity can be accommodated. A generalized description of turbulent transport is proposed for use in combustor flow field calculations. The experimental programme was not successful because of illness and staff changes. (jes)

ABSTRACT: (U) Perfluoro-n-decanoic acid (PFDA) effects  
on protein expression in the rat liver was studied  
following in vivo exposure to PFDA's LD50 and a lesser  
dose. Two-dimensional protein patterns were resolved on  
polyacrylamide gels for whole liver homogenate,  
mitochondrial, microsomal, cytosolic, and isolated  
hepatocyte protein fractions. PFDA exposure caused the  
deletion and induction of numerous proteins often in a  
dose related manner. Several proteins have been  
associated with those involved in lipid metabolism  
alterations characteristically induced by PFDA toxicity.  
Their actual identification awaits further study. The  
results of this project indicate that PFDA has  
significant effect on the quality and quantity of  
specific hepatocellular protein expression but whether  
these alterations are primary or secondary PFDA  
manifestations remains to be determined. (jes)

UNCLASSIFIED REPORT

ABSTRACT: (U) Results are presented of studies on long Josephson junctions and on very small junctions. The long junctions are made out of NbN. Experiments were made on the lifetimes of fluxon states from 2 K to 0.01 K; they are of importance to a fundamental understanding of tunneling and nucleation. Multifluxon resonances were observed and they are of interest to the application of long junctions as high frequency oscillators. Very small junctions, all NbN, were fabricated using a STM approach. Results show the Coulomb blockade, the Coulomb staircase, and the staircase, and the superconducting energy gap. The two types of junctions are being combined to observe Bloch oscillations. (JHD)

UNCLASSIFIED REPORT

ABSTRACT: (U) The objective of this research effort has been to develop algorithms for in situ location and identification, by ultrasound, of flaws in plates or laminated layered elastic materials. Achieving this objective requires detailed knowledge of the excitation, propagation, scattering and detection of high frequency sound waves in the unflawed and flawed environments. Based on an understanding of these fundamental wave phenomena, one may then attempt to construct analytical models with accompanying algorithms, so as to parametrize the NDE problem in terms of good observables. During the contract period, carefully selected prototype problems have been investigated to determine 'good observables' for particular flawed environments. Two major phases have received attention: (a) phenomena within a flat layered plate, especially beam-to-mode conversion, and the consequent interaction with a weak debonding flaw; (b) characterization of transducer outputs in terms of good wave objects that facilitate coupling into and out of the plate environment. The analytical tools rely on spatial and spectral domain formulations, and they comprise self-consistent hybrid beam-mode methods; complex source modeling of Gaussian beams, with complex ray tracing to track such beams; and decomposition of general wavefields into Gaussian beams. Thus, Gaussian beams, which are 'good observables' are central to the problem strategy. (JHD)

UNCLASSIFIED REPORT

ABSTRACT: (U) A grant of \$70,000 from AFOSR was used to buy a 600W CO2 laser. This was combined with items bought with supplemental funds from other sources to assemble a facility for characterization of ceramic materials at extremely high temperatures (up to 2000C is anticipated) in air. The system splits the laser beam into two equal components each of which is coupled into its own computer controlled galvanometric scanner that scans the beam rapidly over a central portion of the front or back surface of a flat specimen. The scan rate and scan density is controlled to yield a test volume, in the mid-section of the specimen, that is at uniform temperature and free of thermal stresses. Related research is developing non-contact methods for strain measurements and damage detection within the central volume of material that is at the test temperature. Characterization of material properties and behavior in a wide range of severe environments will be possible with this system. Keywords: Tough ceramics, Non-destructive evaluation, High temperature. ABSTRACT: (U) Three types of excitation have been explored including soft x-ray pumping from laser-produced plasmas, electron beam pumping, and pulsed jet discharge pumping. Using the laser produced plasmas, new quasimetastable states of barium which radiate in the XUV have been explored and new VUV radiating molecules have been produced. Electron beam pumping has also resulted in the formation of ionic excimer molecules which radiate in the VUV, and considerable kinetic studies were performed to examine the feasibility of producing a VUV laser by this technique. This included the development of the necessary technology to allow electron beam pumping of reactive vapors at approximately 700 degree C and still maintaining compatibility with VUV detection equipment. Using the third excitation technique, pulsed jet discharge pumping, the formation of highly excited ions from the sputtering of low vapor pressure materials used in the pulsed jet nozzle were studied. UNCLASSIFIED REPORT

ABSTRACT: (U) The performance of a simplified adaptive  
algorithm using finite-bit power-of-two quantizer is  
analyzed by assuming Gaussian distributions for both  
input signals and equalizer output errors. The results  
show that in spite of its simple implementation, the  
performance is comparable with the least mean square (LMS)  
algorithm. The convergence and the stability is then  
studied, the output mean square error is analyzed and the  
effects of non-Gaussian cases are considered. Computer  
simulation results support the theoretical results.

ABSTRACT: (U) Three main directions of our research has  
been pursued. New pharmacological evidence is accumulated  
for a mechanism of ACh release related to a muscarinic  
autoreceptor present in the rat iris. Secondly, the study  
of drug effect on release of ACh is continued, adding new  
groups of drugs. Finally, in the effect of aging on  
pupillary function and ACh metabolism are studied. These  
three lines of work have produced novel and intriguing  
results which are summarized in the enclosed section. The  
results described in this report have been communicated  
at several national and international meetings. The  
abstracts of the communication are attached to the final  
report. Keywords: Anticholinesterases; Pupillary function;  
Vision. (jes)

ABSTRACT: (U) Our research centers on the use of Fourier Transform Infrared Spectrometry (FTIS) to determine the distribution of rotational and vibrational energies in molecules. Our particular concern is with the effects of gas-gas and gas-surface collisions on these internal states. By studying the changes in energy and structure that occur during such collisions we aim to elucidate the kinetics and dynamics of the reactive and inelastic scattering events that play leading roles in many important processes of both technological and scientific interest. The collision processes under study are brought about with the aid of supersonic free jets expanding into vacuum from small sonic orifices or nozzles. (JES)

UNCLASSIFIED REPORT

ABSTRACT: (U) A single-pulse shock tube has been used to examine the pyrolysis and rich oxidation of cyclopentadiene as well as its pyrolysis in the presence of acetylene, biacetyl, and benzene. In addition, mixtures of benzene and hydrogen have been copolymerized. These fuels have been diluted in argon and shock heated over the temperature range of 1200 to 2000K and at total pressures of ten to thirteen atmospheres. Dwell times were about 500-800 microseconds. Collected gas samples were analyzed using gas chromatography for hydrogen, carbon oxides and C1 to C14- hydrocarbons. Experimental results and preliminary chemical kinetic modeling lead to mechanistic proposals on the decomposition of C5-rings as well as isomerization processes between C5- and C6-rings. In addition, data on cyclopentadiene indicates that this fuel has a sooting tendency comparable to that of benzene. Keywords: Pyrolysis, Cyclopentadiene, Benzene, Hydrogen addition, Ring formation, Ring isomerization, Soot formation, Soot modeling, Single-pulse shock tube. (JES)

ABSTRACT: (U) Olefin complexes of metals date back to the historic preparation of Zeise's salt in 1827. In recent years several complexes of diphosphenes, diarsenes, and distibines with transition metals have been described, and the coordination chemistry of these unsaturated ligands is now fairly well established. Reactive organosilicon species can sometimes be stabilized by coordination to a transition metal. Examples are the adduct/donor stabilized silylene complexes of ruthenium, iron, and chromium and the recent report of stable silene complexes of ruthenium. In addition, Tessier-Youngs and co-workers have prepared several Pt2Si2 ring compounds whose structural features have been discussed in terms of a bonding model involving the coordination of a planar R2SiSi R2 fragment to two metal moieties. UNCLASSIFIED REPORT

ABSTRACT: (U) This award enabled purchase of three instrumentation systems used research on digital flowfield imaging of reacting flows and plasmas. System I is a high-resolution, high dynamic range, solid-state camera system; System II consisted of elements for 3d flowfield visualization; and System III is an image processing system. System I (funded in FY 84) was completed in the first year and is now in use in fluorescence-based flowfield imaging experiments. System II (funded in FY 85) is not yet fully assembled and will be completed as part of our ongoing research. System III has recently been completed (funding was distributed between FY 84 and FY 85) and is in the final phase of being incorporated into the Laboratory computer networking system.

DESCRIPTORS: (U) \*CAMERAS, COMPUTERS, DIGITAL SYSTEMS, FLOW FIELDS, FLOW VISUALIZATION, HIGH DYNAMIC RANGE, IMAGE PROCESSING, IMAGES, INSTRUMENTATION, LABORATORIES, SOLID STATE ELECTRONICS.

ABSTRACT: (U) Further exploration in the (NZP) - family was carried on-in that the systematic crystal chemistry investigation of  $M1Zr2P3O12$  ( $M1 = Li, Na, K, Rb$  and  $Cs$ ) and  $M11Zr4P6O24$  ( $M11 = Mg, Ca, Sr, Ba$ ) was completed and few more new compositions were synthesized and characterized. An effort was made to grow single crystals of  $Na, Sr$  and  $Ca$  zirconium phosphates using  $B2O3$  as flux in order to obtain more data to confirm the results obtained on powdered samples.  $NaGe2P3O12$  was studied as a potential candidate for the development of glass-ceramic due to its low melting behavior. It has been established that sol-gel process is superior to powder method for synthesizing (NZP)-compounds and therefore most of the compositions were prepared by this route. Dielectric measurements made on  $CaZr4P6O24$  showed that in general, (NZP)-materials have low dielectric constant with relatively low loss. New families such as diborides and  $Al2O3-GeO2$  were investigated in order to search any new low thermal expansion composition with high dielectric constant. (JES)

UNCLASSIFIED REPORT

ABSTRACT: (U) This report reviews a theoretical framework and empirical research concerning the interactions between cognitive abilities (both general intellectual and perceptual speed) and self-regulatory/metacognitive processes (including emotion control and motivation control) during complex skill acquisition. The framework outlines how ability and metacognitive strategies affect attention and cognitive effort as determinants of individual and group differences in task performance during skill acquisition. Specifically, the self-regulatory strategy of emotion control affects task performance early in skill acquisition, when strategy of emotion control affects task performance early in skill acquisition, when attentional resource demands are diminished. Individual differences in general ability interact with the dynamic attentional demands of complex tasks during training, and thus further interact with the influence of these two self-regulatory strategies. Two experiments delineating the interactive effects of training for emotion control and motivation control were conducted, with a criterion air traffic controller simulation task. (SDM)

ABSTRACT: (U) This report summarizes major accomplishments covering the period 15 March to 13 June. A paper entitled 'Velocity Field Characteristics of III-V Semiconductor Alloys,' which was submitted to the Journal of Applied Physics is attached as Appendix A. Our aim in this period has been to expand the work to study the effect of ionized impurity scattering and strain scattering on the electron mobility. The modified electron mobility will, in turn, affect velocity-field (v-E) characteristics in semiconductors and their alloys. Ionized impurity scattering is treated in a second order perturbation theory. Our improvement over previous theories is to convert the usual integration over a parabolic energy band to a general Brillouin Zone (BZ) integration. This conversion allows us to incorporate the effect of realistic band structures into this transport calculation. (jes)

UNCLASSIFIED REPORT

ABSTRACT: (U) This report describes work on mental imagery, short term memory scanning, language-related mental tasks, and visual attention. In the field of mental imagery it was found that searching memory to determine if or if not a visual form had been seen before, there is a change in the state of the occipital (visual) cortex. This change is commensurate in time with the reaction time indicating that the mental search is complete. It was also shown that engaging in language related tasks does not have a similar effect on visual cortex, but it does have a similar effect on temporal cortex. Using visually presented words to initiate a mental imaging task results in related changes in activity of visual cortex, and also temporal cortex. However, when the same words are used in rhyming tasks, the major effect is on left temporal cortex. Using acoustically presented words in a similar task produces parallel results, although the effects on visual cortex are not so reliability found across subjects, and both imaging and rhyming affect temporal cortex, suggesting a role for language in imagery. In another memory scanning experiment subjects attempted to determine if a musical note was or was not a member of a set of previously heard

ABSTRACT: (U) This project was an attempt to understand the major functions of early vision by considering how various components cooperate in preparing visual information to organize our perceptions of the world around us. To this end, and with the cooperation of SRI's Machine Vision Group, we assembled some of these functions in a computational working model, which can graphically display the spatial structure of the formation at a given stage of the visual process, in the form of a two-dimensional intensity array (or 'image'). This capability was developed to facilitate the study and comparison of retinal and cortical inputs and outputs of spatial information. The individual components of the model are well known, and the relations among them are based on available data from the literature. However, two aspects of this project seem novel. One is the exploitation of powerful, state-of-the-art tools of computational vision, such as Symbolics 3600-series LISP machines, to create and display our results. These tools were developed primarily for artificial intelligence purposes; they have rarely been used for basic studies in human vision. (JES)

ABSTRACT: (U) The essence of this AFOSR project is investigation of the structure, composition, mode of attachment and reactivity of the surface molecular species which form when metals come into contact with fluids. A series of findings, advances in investigation technology and 91 scientific articles have occurred thus far during this project. These include: (i) determination of the orientations and modes of attachment of organic molecules attached to electrode surfaces; (ii) demonstration that each orientation of an adsorbed molecule manifests different chemical and electrochemical reactivity; (iii) discovery that electrodeposition of metals at single-crystal surfaces produces highly-ordered layers; (iv) discovery that contact between metal surfaces and ionic solutions forms chemically unique, ordered layers; (v) adaptation of electron energy-loss spectroscopy (EELS) for measurement of vibrational spectra of molecules adsorbed at metal surfaces from solutions; (vi) systematic study of 150 adsorbed phenols, acids, amines, pyridines, mercaptans, alcohols, alkenes and aromatics as a structure (LEED), composition (Auger), molecule construction/mode of surface attachment (EELS), chemical reactivity (all methods), and electro-chemical reactivity (cyclic voltammetry, CV); (vii) demonstration of the stability of these adsorbed layers toward vacuum and electron beams used in surface spectroscopy by performing CV before and after the electron spectra were obtained; and, (viii) studies of surface structure by means of Auger electrons. ABSTRACT: (U) During the past year, we have worked on several research projects in the areas of reliability, stochastic systems, environmental models, life and social sciences, among others. In structuring the various statistical models in these areas, our aim was to clearly identify the problem under investigation, formulate the problem in such a manner so as to be mathematically complete, illustrate the usefulness of our findings with real data when available or depend on numerical simulation and interpret the final results. (KR)

DESCRIPTORS: (U) , ENVIRONMENTS, MATHEMATICAL MODELS, MODELS, NUMERICAL ANALYSIS, RELIABILITY, SOCIAL SCIENCES, STATISTICAL ANALYSIS, STOCHASTIC PROCESSES.

ABSTRACT: (U) The research work on this project has been concerned with dynamic effects on fracture. Two main areas have been investigated: 'high-rates loads on bodies containing cracks,' and 'fast fracture and crack arrest.' Dynamic effect become important if the external loads give rise to propagating mechanical disturbances (as for impact loads and explosive charges) which can strike a crack and cause crack propagation. Spalling is an example of a fracture phenomenon caused by the rapid application of loads. Dynamic effects become also important if a crack propagates very rapidly, so that rapid motions are generated in the solid. Even though in most cases fracture studies should focus on despite the best attempts for prevention. (JES)

ABSTRACT: (U) The two-terminal reliability problem for  
an undirected network involves calculating the  
probability that two distinguished sites are connected by  
a path of working edges. This problem is known to be NP-  
hard, even for the special case of planar systems. We  
present efficient data structures and algorithms for  
manipulating planar networks and for generating both  
paths and cutsets in such networks. A pseudopolynomial  
algorithm is then implemented, based on these generation  
procedures, to calculate two-terminal reliability for  
planar networks; that is, the algorithm's time  
complexity is polynomially bounded in the number of paths  
(or the number of cutsets). Computational experience with  
this implementation is also presented in this reprint  
showing that it provides a substantial improvement over  
previous implementations of the pseudopolynomial  
algorithms. (KR)

UNCLASSIFIED REPORT

ABSTRACT: (U) The main goal of this project is to estimate theoretically the overall or effective constitutive properties of nonlinear composite materials undergoing large deformations. Two types of large deformations are of interest; large elastic deformations, and large viscous deformations. The proposed method is to apply variational principles that are under development to characterize the range of the effective properties given partial statistical information about the microstructure (such as the volume fractions of the phases). For some particular microstructures of interest exact estimates may be given. Significant progress was made over the first year with the development of a new variational principle allowing the estimation of the effective properties of a given nonlinear composite in terms of the effective properties of linear composites (which are assumed to be known). The potential significance of this work derives from its simplicity allowing the application of a large body of prior research on linear composites to nonlinear composites. The method has been applied to the case of large viscous deformations, and some results for particular materials systems have already been reported in the pertinent literature. Keywords: Nonlinear composites; Finite elasticity; Creep; Plasticity; Variational principles;

UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Pub. in Combust. Sci. and Tech., v70  
p47-73 1990.

ABSTRACT: (U) Previous experimental investigations of turbulence measurements in conventional laboratory premixed flames are extensively reviewed. Because of numerous disadvantages of these configurations, primarily associated with flame stabilization mechanisms, a freely-propagating flame configuration is proposed for the study of flame-turbulence interactions. The unperturbed, unrestrained flow field in this configuration is ideal for measuring the effect of the flame on turbulence properties. Temporally resolved, ensemble averaged measurements of turbulence intensity, integral length scale, integral time scale, and energy spectrum have been measured both normal and parallel to the mean flame surface with laser Doppler velocimetry (LDV) in a propane-air flame at an equivalence ratio of 1.0, in a flow with incident turbulence intensity of 25 cm/s and length scale of 8 mm. The following changes in turbulence parameters were observed across the flame: a factor of five to six increase in the normal turbulence intensity, a factor of two to three increase in the parallel turbulence intensity, a factor of two increase in the density weighted turbulent kinetic energy, a 100% increase in the normal length scale, a 50% increase in the parallel length scale, an increase in turbulence time scale, and a

AD-A224 500

slight shifting of turbulence energy towards lower frequencies in the normal component. These results indicate that turbulence production in the flame is significant, and is anisotropic in nature. Keywords: Premixed turbulent combustion, Flame generated turbulence, Reprints. (JHD)

900024, 9p 1990.

ABSTRACT: (U) During the course of this research,  
several trips were made to LEAR (the Low Energy  
Antiproton Ring) in Geneva. On one trip, the feasibility  
of using a thick beryllium degrader to slow antiprotons  
enough to permit capture was established. On another trip,  
approximately 1000 antiprotons were captured and held for  
about ten minutes. Subsequently, a completely new  
apparatus was designed using a proper superconducting  
magnet, and a beam line at LEAR was designed for the mass  
measurement. At the end of the research period, all  
apparatus and arrangements were complete for making the  
measurement of the antiproton inertial mass. Keywords:  
Antimatter, Antiproton, Trapping. (JHD)

ABSTRACT: (U) A model of turbulent flame kernel growth  
has been developed based on the fractal nature of  
premixed turbulent flame structure. The flame kernel  
model uses a recently developed heuristic model for the  
fractal dimension of premixed turbulent flame surfaces in  
order to predict the flame kernel's structure. The  
fractal flame kernel model requires independent knowledge  
of the turbulence intensity, Kolmogorov scale, integral  
scale and energy spectrum, as well as, the laminar flame  
speed. Comparisons with measurements from the turbulent  
flow tunnels and engines show good agreement with the  
fractal model's predictions. Keywords: Turbulent flame  
growth; Reprints. (JHD)

ABSTRACT: (U) Applications of Embedded Optical Fiber Sensors in Reinforced Concrete Buildings and Structures. The potential use of optical fiber sensors embedded prior to curing, in reinforced concrete buildings and in structures such as bridges, dams and tanks is discussed with regards to the non-destructive measurement of internal strain, and the evaluation of structural integrity. Novel applications in the areas of structural monitoring, experimental stress analysis and in the management and control of service installations are presented. A discussion of the fundamental issues regarding the practical implementation of this technology is given. (rh)

UNCLASSIFIED REPORT

ABSTRACT: (U) Research on systems reliability and inference were focussed on three major areas: linear approximations for estimating first and second moments for a variety of different models; delayed reporting models, with emphasis on predicting unreported counts generated over a fixed exposure interval; and generalized models of life testing with incomplete data. Contents: Approximations for Bayesian Estimation and Prediction; Delayed Reporting Models; Life Testing with Incomplete Data. (KR)

ABSTRACT: (U) The paper is concerned with propagation of chaos problems for systems with an infinite number of degrees of freedom such as strings or spatially extended neurons. The investigation of the asymptotic behavior of the voltage (membrane) potentials of large assemblages of interacting neurons leads to precisely such problems and provided the immediate motivation for the work. Another example to which the approach of the present paper could be applied is the Ginzburg-Landau model in hydrodynamics. Basic properties of duals of nuclear spaces (denoted throughout by  $\Psi$ , the strong dual of a countably Hilbertian nuclear space  $\Psi$ ) are briefly discussed and the results of Kallianpur et al. on the existence and uniqueness of the solution to (the martingale problem posed by) a  $\Psi$ -valued stochastic differential equation (SDE) is extended to a system of such equations. The principal results in which the infinite dimensionality of our problem call for special arguments are derived. (JHD)

UNCLASSIFIED REPORT

ABSTRACT: (U) When learning new cognitive skills involving problem solving, novices are often reminded of earlier problems. The use of earlier problems is a common means of problem solving and affects the learning of the skill. This project has three aims in understanding this learning. First, the representation of the resulting generalizations is being examined. Generalizations formed from reminders are likely to be conservative, in that they may be more tied to the examples than many current theories allow. A main aim of the project is to distinguish and test different forms of this conservatism. Second, the development of problem solving expertise is examined by focusing on differences in how typical and atypical problems are solved. Third, the effects of such reminding-based learning in everyday problem solving is examined to extend the findings and test some theoretical ideas that are difficult to investigate in more formal domains. UNCLASSIFIED REPORT

ABSTRACT: (U) The objective of this project was to establish the theoretical foundations for applying higher order Rayleigh and interface modes to resonators for high stability sensors. Theoretical studies of the characteristics of Rayleigh waves in single and multi-layer structures were carried out for ST-cut Quartz substrates. Specified materials for this study were MgO, Y2O3, AlN, SiOx, Al2O3, and TiO2. Velocity dispersion and coupling to bulk modes were predicted and confirmed by comparison with experimental results for sputtered films. Stoneley (interfacial) waves were investigated as possible candidates for resonator structures because of their inherently stable and low cost geometry without any type of hermetic enclosure or package. A successful search technique was developed which accurately predicts the existence of Stoneley waves in general anisotropic (and piezoelectric) materials. Using this technique, Stoneley waves were found for the first time predicted in single crystal quartz. Several useful orientations where Stoneley waves are well bound and piezoelectrically active were found to exist. (rh)

ABSTRACT: (U) The purpose of this project was to advance the understanding of the propagation of ultrafast picosecond electromagnetic pulses in biological solutions and ultimately, in human tissue. Present day standards of the allowed electromagnetic doses do not include dispersion, modulation or envelope effects, memory or nonlinearity. It is well-known experimentally that biological solutions are highly dispersive. It is plausible, but not established, that modulation, memory and nonlinearity may be important in biological solutions. Hence, this project represents a first step toward better standards. (jhd)

ABSTRACT: (U) Our primary objective is to carry out a cellular and computational analysis of operant conditioning of the headwaving response in Aplysia. Progress has been made in four areas: (1) We have now unequivocally identified the neural pathway essential for reinforcement: a bilateral set of nerves from the oral veil. (2) We have achieved reliable stimulus control over the operant response (headwaving) by our discovery that Aplysia shows a strong positive phototaxis to a directional light source. (3) We have identified the neural pathway necessary for phototaxis: the nerves from the primary visual organs (the eyes and rhinophores). (4) We have preliminary evidence that headwaving motor neurons can be operantly conditioned (by direct injection of hyperpolarizing or depolarizing current, paired with reinforcement) to increase or decrease their spontaneous firing rate. ABSTRACT: (U) The important issue of how the superconducting transition temperature  $T_c$  in disordered systems changes near the M-I transition where strong localization is expected has been studied in the Mo-Ge system. In the high Mo concentration, which is in the weakly localized regime,  $T_c$  decreases linearly with decreasing Mo concentration from 7.5 K (78 at Mo) at a rate of 0.18 K/at % Mo. In this region the ratio of electron-phonon coupling constant  $\Lambda$  to the bare density of states  $M_b(0)$  is constant, which is consistent with the Varma-Dynes tight-binding model. An extrapolation of the linear behavior of  $T_c$  in this regime yields the disappearance of  $T_c$  near 35 at Mo. However, measurements show that  $T_c$  exists down to 13.5 at Mo. A non-superconducting metallic phase is found to exist between 13.5 at 10.4 at Mo at which concentration the insulating phase occurs. (jes)

ABSTRACT: (U) Two essential difficulties must be addressed in any low-power frequency conversion device; boosting the efficiency above that of simple single-pass bulk devices (which are typically less than 1%/W) and achieving phase-matching for the desired interaction. Waveguide interactions were used to increase the conversion efficiency, and explored quasi-phase-matching (QPM) as a broadly applicable approach to meeting the phase-matching condition. Both oxide ferroelectrics like LiNbO<sub>3</sub> and quantum-wells in III-V semiconductors have been investigated for these applications. Second harmonic generation (SHG) of near-infrared lasers to produce green and blue radiation, as well as SHG of the 9-11 micrometer output of a CO<sub>2</sub> laser have been demonstrated in these materials. These media together constitute a significant step towards the goal of generic nonlinear media for the far-infrared - ultraviolet, based on readily available materials and fabricated with standard technologies, applicable to essentially any frequency conversion application. UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Pub. in Jnl. of the American Chemical Society, v112 p4960-4962 1990.

ABSTRACT: (U) Ru(bpy)<sub>2</sub>(dppz)<sub>2</sub><sup>+</sup> is a highly sensitive spectroscopic reporter of double-helical DNA. In aqueous solution, luminescence is detectable only when Ru(bpy)<sub>2</sub>(dppz)<sub>2</sub><sup>+</sup> has intercalated in (or is perhaps otherwise shielded by) the nucleic acid structure. The emission characteristics furthermore sensitively distinguish both in terms of intensity and emission maximum the different helical forms of the polynucleotide. Therefore, we conclude that Ru(bpy)<sub>2</sub>(dppz)<sub>2</sub><sup>+</sup> can serve as a true molecular 'light switch' for DNA structures, and tethered onto oligonucleotides, the complex may be useful as a sensitive, nonradioactive, luminescent DNA probe in both heterogeneous and homogeneous assays. TR-90-0662

ABSTRACT: (U) The aims of this research are to study each of the various molecular mechanisms whereby toxic metal cations and oxyanions are chemically transformed by *Pseudomonas maltophilia* strain OR-02. The research effort for the current year has focused on the microbial-dependent transformations of selenite, tellurite, lead, and chromate. The reduction of selenite and tellurite to their insoluble elemental forms appeared to be mediated by an intracellular glutathione reductase that utilized the spontaneously-formed bis(glutathio)Se or bis(glutathio)Te, respectively, as pseudosubstrates. The biomolecules responsible for the extracellular transformation of lead and the reduction of chromate to Cr(III) are currently under investigation. This project could provide useful information toward the eventual exploitation of *P. maltophilia* and related organisms for the removal of toxic metal wastes from selected, heavily polluted sites. ## UNCLASSIFIED REPORT

ABSTRACT: (U) The project involves study of the theoretical properties and computational performance of techniques that solve linear and nonlinear programs by means of nonlinear transformers. The group at the Systems Optimization Laboratory (SOL) were the first to recognize the connection between Karmarkar's (1984) projective method and the logarithmic barrier method (see Gill, Murray, Saunders, Tomlin and Wright, 1986). It is now generally recognized that essentially all interior-point methods for linear programming inspired by Karmarkar's method are closely related to applications of Newton's method to a sequence of barrier functions (see e.g., Gonzaga, 1987; Renegar, 1988; Anstreicher, 1988). Each barrier function is defined from the objective function and a barrier term that is infinite along the boundary of the feasible region. As the weight on the barrier term is reduced to zero, the solution of the subproblem becomes closer to the solution of the original problem. (kr)

## UNCLASSIFIED REPORT

ABSTRACT: (U) A joint experimental and numerical study of droplet dispersion in a round turbulent jet has been initiated. Laser light scattering was used to measure the motion of non-vaporizing droplets of water and hexadecane in an isothermal turbulent jet of air. The results indicated that an initial radial velocity fluctuation in the droplet motion at the jet exit can serve to increase significantly the dispersion of droplets larger than 100 microns. Vortex dynamics simulations of the near region of the jet showed that Basset, virtual mass and pressure gradient forces may be neglected for small droplets but may need to be accounted for, particularly at high pressure, with large droplets (> 100 microns) even if the drop to gas density ratio is close to one. A stochastic simulation of particle dispersion revealed that the Reynolds stresses or velocity correlations in this flow do not contribute significantly to particle dispersion. Keywords: Turbulent shear flows, Particle dispersion, Vortex dynamics, Stochastic simulation. (jhd)

ABSTRACT: (U) The orientation of CO on the steps of  
Pt(112) (Pt(S)(111)x(001))) was studied by digital  
electron stimulated desorption - ion angular distribution  
(ESDIAD), monitoring the z-3-Pt-CO state. At low  
coverages, CO is adsorbed exclusively on step sites. At  
higher coverages, one - dimensional CO-CO repulsions  
result in tilting along the steps. When the steps are  
filled, all step CO molecules reorient orthogonally with  
new tilt angles up and down the steps. The selection of  
orthogonal tilt directions at various coverages has not  
been observed previously. These CO tilting effects are  
primarily due to steric repulsions rather than static  
dipole - dipole interactions. Keywords: Carbon monoxide,  
platinum, Chemisorption, Steric effects, Electronic  
stimulated desorption. (JES)

UNCLASSIFIED REPORT

ABSTRACT: (U) In Part 1, a model for subgrain  
superplasticity has been developed. Aluminum alloys that  
contain low angle boundaries exhibit different  
superplastic behavior than alloys consisting of high  
angle boundaries. On a relative basis, the low angle  
boundaries increase the flow stress but impart a greater  
resistance to cavitation; the strain-rate sensitivity of  
this material is generally smaller and the change in the  
strain-rate sensitivity with strainrate shows a minimum  
instead of a maximum as observed in the large angle  
boundary materials. As a result, the subgrain material  
can be deformed to a large tensile strains at fast strain  
rates. A kinetic model for subgrain superplasticity that  
invokes a balance between the arrival and emission rates  
of dislocation at low angle boundaries is presented. It  
explains several features of subgrain superplasticity. It  
also explains why ultrafine dispersoids of intermetallics  
appear to stabilize the subgrain structure in aluminum.  
Early work on the correlation between flow stress and  
subgrain size in dynamic recrystallization of metals may  
also be consistent with the model. (JES)

ABSTRACT: (U) The goal of this program was to develop key concepts for optical symbolic computing. During the course of the program, both a top-down and bottom-up approach was taken to develop an architecture for symbolic computing. The approach was intended to result in an architecture suitable for the design goals while being implementable with practical components. Key results of the program include the following: Design of a unique symbolic processing architecture, Identification of lack of suitable addressable optical memory as a major impediment in the implementation of existing paradigms, Demonstration of a unique, critically needed polarization based modulator with 17 dB extinction ratio, and demonstration of the world's highest extinction ratio (23 dB) of AlGaAs/GaAs modulator at 1 GHz, and Demonstration of high density modulator arrays with the world's smallest pitch (20 um) and less than 20 dB crosstalk. ABSTRACT: (U) In the second year of the grant I continued three projects initiated in the first year, and began two new lines of research. A study of contouring coding in normality judgements yielded disappointing results. We started a systematic exploration of the relation between discriminability and similarity, which we plan to extend to categorization and normality. A series of studies established essentially perfect dimensional independence in object-specific priming. We conducted a theoretical and empirical examination of close counterfactuals. Two separate projects dealt with the process of comparison, continuing and extending work reported last year. Keywords: Perception, (Psychology), Categorization, Comparison processes, Normality. UNCLASSIFIED REPORT

ABSTRACT: (U) An attempt was made to accelerate the reentrainment of circadian rhythms in squirrel monkeys exposed to 8-hr phase advances and phase delays of the daily light-dark cycle by timed administration of the short-acting benzodiazepine, triazolam. On the day of the phase advance, each animal received a single injection of triazolam (0.3 mg) or of vehicle alone in mid-subjective day, 2 hr after the new time of dark onset, while on the day of the phase delay, the animals received triazolam or vehicle in late subjective night, just before dark onset. The daily acrophases of the circadian rhythm of body temperature were calculated by cosinor analysis, and exponential functions were fitted to the acrophases that followed each of the phase shifts. The rates of reentrainment, defined as the time required for the exponential functions to reach 90% of their asymptotic values, were slower after the phase advance than after the phase delay but did not differ significantly between drug and vehicle conditions. Keywords: Circadian rhythms, Entrainment, Body Temperature, Phase shift, Benzodiazepines, Triazolam. (JES)

ABSTRACT: (U) Neurophysiological experiments have been directed at gaining an understanding of how auditory neurons encode pitch related information in the temporal properties of discharge. In general, all physiological neuronal types recorded to date in the chinchilla cochlear nuclei can show periodicities in their discharges that are related to the pitch of harmonic tone complexes, but only those neurons that show phase-locking at best frequency can encode the pitch related information in cost + rippled noise. The results of binaural psychophysical experiments suggest (1) that the number of components in the tone complex are relatively few (less than 10) and there are no dynamic binaural cues to aid segregation of the target from the background, and (2) that waveforms having large effective envelope depths are on the average more easily lateralized than those having small effective envelope depths. ABSTRACT: (U) A completely ab-initio investigation of grain boundaries in solids has been performed for the first time. The electronic and structural properties of two short-period twist boundaries in Ge have been explored and found to be extremely complex. Boundary bonds are found to be distorted and weak, three-fold and five-fold coordinated defects appear to exist, and topological disorder in the form of odd and even numbers of rings of bonds is found to prevail. Complete total energy surfaces as a function of displacement of one grain over the other have also been mapped out. The results predict that there is a large degeneracy in the number of local energy minima, that tunneling-like modes should exist in these boundaries, that the formation energies of the boundaries lie in the range between 4 and 7 eV per unit cell, that the boundary volumes involve expansions in the range of 0.1 to 0.3 A/unit area, that trends toward dimerization exist parallel to the boundary planes, that electronic states will exist deep in the fundamental gaps of these systems. **ABSTRACT:** (U) Efforts to understand the perception of complex auditory stimuli produced four different research undertakings. Studies have been done both with computer simulations and human listeners, the most precise psychophysical procedure to estimate a discrimination threshold. A technique to determine the listener's sensitivity to synchrony was perfected in envelope modulation produced at two separate regions, and have measured such sensitivity using a variety of different stimulus parameters. Sensitivity to modulation synchrony is essentially independent of the locus of the two frequency bands. Studies have also been done on temporal factors that influence the ability to discriminate an increment in the level of a single component of a multi-tonal complex. Very slight differences in the temporal onset (>20 msec.) of tone and complex strongly influence the ability to make such discrimination even when the entire stimulus lasts 500 msec. Finally, we continue to study the estimates of spectral weights used in such intensity discrimination tasks, using the COSS analysis. **Keywords:** Psychoacoustics. (CP)

ABSTRACT: (U) A general geometrically-exact Lagrangian mechanics formulation for the aeroelastic analysis of a maneuvering aircraft has been presented. The motion of the aircraft is expressed in terms of the location of the origin of a body frame of reference, the rigid-body rotation of the body frame of reference, and a deformation. The Lagrangian equations of motion for the corresponding degrees of freedom have been obtained. A formulation has been specialized to the case of a fluttering buckled plate on an aircraft undergoing a pitching maneuver. Assuming that the maneuvering of the aircraft is prescribed, the Lagrange equations of motion for the elastic degree of freedom has been derived. This equation is then used to study the response of the panel of an aircraft engaged in a pull-up maneuver. The large-amplitude responses are investigated by using the digital computer. As the maneuvering (load-factor) increases, system exhibits complicated dynamic behavior including period-multiplying and demultiplying bifurcations and chaos. Keywords: Aircraft; Dynamic response; Lagrangian functions; Bifurcation(Mathematics); Maneuverability. (cp)

UNCLASSIFIED REPORT

ABSTRACT: (U) The overall goal of this research project is to investigate the cellular and membrane mechanisms associated with the heterosynaptic modulation of long-term synaptic potentiation (LTP) at mossy fiber synapses in the hippocampus. We have previously shown that norepinephrine, through beta-adrenoceptors, enhances the mossy fiber LTP, while acetylcholine, through muscarinic receptors, depresses the magnitude and probability of induction of mossy fiber LTP. The goal for the second year of this research project was to test several specific hypotheses for the induction of mossy fiber LTP. Specifically, the hypotheses relate to the possible requirement of postsynaptic calcium entry through voltage-gated calcium channels during the induction LTP. Moreover, we have been investigating the properties and distribution of voltage-gated calcium channels in hippocampal neurons and the modulation of these calcium channels by noradrenergic and cholinergic agonists. In a collaborative project with Dr. David Terrian, originally at the USAFSAM in San Antonio and now at East Carolina University, the mechanisms of neurotransmitter release from a homogeneous fraction of mossy fiber synaptosomes have been investigated. Keywords: Long-term potentiation, Norepinephrine, Acetylcholine, Synaptic plasticity.

ABSTRACT: (U) The organic transient molecule ketene imine,  $\text{CH}_2\text{CNH}$ , which may be important to the chemistry of the interstellar medium, has been produced by thermolysis of 3-hydroxypropionitrile,  $\text{HOCH}_2\text{CH}_2\text{CN}$ , and its He I photoelectron spectrum obtained for the first time. The interpretation of the spectrum is assisted by the calculation of the lowest four vertical ionization energies by a recently developed ab initio multireference coupled-cluster method (MRCC) and the SCF calculation of the vibrational frequencies of the lowest two cationic states. The lowest three observed ionization energies are 9.28, 11.91, and 13.04 eV. A fourth ionization is observed in the range 15-16 eV, but precise measurement is not possible because of contamination of this region of the spectrum by formaldehyde. The MRCC calculations predict ionization energies of 9.18 (a'), 12.03 (a'), 13.17 (a'), and 15.68 (a') eV. Additional experimental and MRCC results for ketene N-methylimine,  $\text{CH}_2\text{CNCH}_3$  provide further confirmation of the assignments for ketene imine. (jes)

UNCLASSIFIED REPORT

ABSTRACT: (U) A 1-Hz hypocycloidal pinch (HCP) pumped laser was operated at 1 kJ input energy. The time integrated continuum spectrum of the pump light approximated that of a 15,000 K blackbody for the wavelength range above 250 nm. The pump emission was found to be stable at 1 Hz operation. The overall efficiency of the system was found to be 0.01% for single shot operation of pumping blue-green and near ultraviolet (uv) dye lasers 2 MW, but the laser output saturated with the input energy 4 kJ due to thermal lensing effects in the dye. Thermal effects introduced by nonuniform heating of the dye solution resulted in a reduction of the uv laser output as repetition rates increased. The thermal effects were significantly reduced by using a double walled dye cuvette. A theoretical model was developed to describe the electromagnetic acceleration of the plasma produced in the HCP device. The computer model described the operation of the device in the snow-plow mode and took into account the unique geometry and electrical parameters of the HCP devices used in the laboratory. Keywords: Ultraviolet lasers; Electrooptics; Equations of motion. (cp)

UNCLASSIFIED REPORT

ABSTRACT: (U) Previous studies have shown that high-dose exposure to the halocarbon bromobenzene resulted in hepatotoxicity and lethality that was substantially diminished by co-treatment with the alpha-adrenergic antagonist, phentolamine. The purpose of this study was to compare the hepatotoxicity resulting from exposure to the related halocarbons, chlorobenzene, bromobenzene and iodobenzene, and to determine whether the resulting hepatotoxicity could be antagonized by phentolamine. Halobenzene-induced changes in hepatic glutathione concentrations and serum concentrations of catecholamines were determined as possible mediators of hepatic damage. Iodobenzene administration resulted in toxicities similar to that seen with bromobenzene. Administration of either iodobenzene or bromobenzene resulted in hepatotoxicity as measured by serum alanine aminotransferase (ALT) activity about 1000 fold above normal values. Chlorobenzene was also capable of producing hepatotoxicity, but not to the same extent as iodobenzene. Chlorobenzene-induced hepatotoxicity resulted in serum ALT values approximately 100 fold above normals. Chlorobenzene, bromobenzene or iodobenzene administration significantly decreased hepatic glutathione concentrations to approximately 20% of control concentrations. Phentolamine co-treatments significantly decreased serum ALT activity for all three compounds suggesting that hepatotoxicity might be

ABSTRACT: (U) Reactions of the electronically-excited species,  $N_2(A\ 3\Sigma_g^+)$  sub  $u, v$ , with selected molecules have been studied via measurement of the dependence of the rate constant on vibrational quantum number,  $v$ , determination of the products of electronic quenching, and measurement of vibrational distributions in product fragments of dissociation channels, using laser induced fluorescence and atomic resonance fluorescence in discharge flow systems. Similar investigations of key reactions of electronically excited  $CO$ ,  $Ar$ ,  $Kr$  and  $Xe$  have also been undertaken. The rate constants for several inefficient quenchers are greatly enhanced by vibration in  $(N\ sub\ 2)(A)$ . An empirical correlation shown by these data is consistent with quenching via near-vertical transitions in the  $N\ sub\ 2$  and in electronic excitation of the reagent molecule, generally to a dissociative state. Keywords: Energy transfer; Laser induced fluorescence; Molecules; Molecular spectroscopy. (cp)

ABSTRACT: (U) This project investigated the possibilities of improved performance in the standard GaAs field effect transistor structures. A secondary objective was to determine the extent to which Deep UV Lithography could be used as a technique to produce high resolution geometries. One can now routinely produce .5 micron gate geometries with Deep UV lithography and occasionally sub .25 micron structures. This technology is used to produce devices with state of the art electrical characteristics. Into the last term of the contract A novel structure will be used to try and increase the output conductance of these devices. The annealing of uncoped epitaxial material will also be investigated. UNCLASSIFIED REPORT

ABSTRACT: (U) This dissertation investigates the behavior of both unbounded and bounded compressible plane mixing layers with respect to two- and three-dimensional, spatially growing wave disturbances using linear stability analysis. The mixing layer is formed by two parallel streams with different gases and the flow is assumed to be inviscid and non-reacting. For unbounded mixing layers, the effects of the free-stream Mach number, velocity ratio, temperature ratio, gas constant (molecular weight) ratio and the ratios of specific heats on the linear spatial instability characteristics of a mixing layer are determined. A nearly universal dependence of the normalized maximum amplification rate on the convective Mach number is found for two-dimensional spatially growing disturbances. The effects of the mean flow profiles on the instability behavior of the mixing layers are also studied. It is shown that decreasing the thickness of the total temperature profile relative to the mean velocity profile, or adding a wake component in the mean velocity profile can make the normalized amplification rate decrease slower as the convective Mach number increases for both subsonic and supersonic convective Mach numbers. For an unbounded mixing layer with subsonic convective Mach numbers, there is only one unstable mode propagating with a phase

SUPPLEMENTARY NOTE: Pub. in Proceedings of the Conference on Decision and Control, IEEE (28th) p1267-1272 Dec 89.

ABSTRACT: (U) We consider partially observable Markov decision processes with finite or countable (core) state and observation spaces and finite control space. Following a standard approach, an equivalent completely observed problem is formulated, with the same finite control space but with an uncountable state space, namely the space of probability distributions on the original core state space. It is observed that some characteristics induced in the original problem due to the finiteness, or countability, of the spaces involved are reflected onto the equivalent problem. Sufficient conditions are then derived for a bounded solution to the average cost optimality equation to exist. We illustrate these results in the context of machine replacement problems. Structural properties for average cost policies are obtained for a two state replacement problem, similar to available results for discount optimal policies. The set of assumptions used seems to be significantly less restrictive than others currently available. Keywords: Reprints. (kr)

ABSTRACT: (U) Nearly all fractures of polymeric  
materials occur during dissipative deformations. Thus,  
their strength is determined by the number of associated  
or relevant viscoelastic mechanisms present in their  
response. A number of investigations have contributed to  
the establishment of the preceding conclusion. Only with  
great care and effort can fractures be brought about at  
relatively high temperatures and long times, or in the  
swollen state, so that chemical bond strengths can  
principally determine the material's strength. This study  
has been directed toward the elucidation of how molecular  
architecture and the chemical type of network polymer  
determine the viscoelastic processes which are relevant  
to fracture behavior. Several series of elastomeric  
materials have been studied. Both the fracture and the  
viscoelastic behavior of urethane end-linked  
polybutadienes, dicumyl peroxide crosslinked  
polybutadienes, fluorinated hydrocarbon elastomers  
(Viton<sup>®</sup> A fluor elastomer), and a urethane end-linked  
styrene-butadiene rubber (SBR) have been determined.

ABSTRACT: (U) The goal of this project was to provide preliminary data regarding the hepatotoxic and immunotoxic effects of perfluorodecanoic acid (PFDA). Flow cytometric evaluation of hepatocytes from PFDA-treated rats revealed an increase in size and granularity and a shift from tetraploidy towards diploidy, in rats treated with 50 mg/kg PFDA, as well as a suggestion of interference with lymphocyte blast transformation of splenocytes in these rats. These preliminary studies suggest that PFDA induces hepatocellular alterations which are detectable by flow cytometry, and induces both morphologic and possibly functional modulation of the immune system. Further studies are indicated to determine the significance of these findings. Keywords: Perfluorodecanoic acid(PFDA); Hepatocarcinogenesis; Preneoplastic lesions; Flow cytometry; Immunotoxicity. ABSTRACT: (U) ZnSe was doped with Ga to electron concentrations in the low 10 to the 17th power/cc. range. It was determined that optimum doping occurred for a Se: Zn flux ratio of close to unity as measured with a quartz crystal monitor. DLTS measurements indicated that delta doped samples had an order of magnitude less deep level traps than uniformly doped samples. Monte Carlo simulations of the growth kinetics of ZnSe, combined with absolute flux measurements, provided information about sticking coefficients and insight into stoichiometric growth conditions. The nucleation of epitaxial ZnSe on epitaxial GaAs was studied for the first time. MISFET devices were fabricated, and MIS capacitor C-V characteristics were used to evaluate the properties of the heterovalent interface. Techniques were found by which interface state densities were reduced to values comparable to (Al,Ga)As. Keywords: Monte Carlo method; MOSFET semiconductors; Lattice dynamics. (CP)

**ABSTRACT:** (U) Abstract of Dissertation: Electromagnetic Excitations on Antiferromagnets: Surface Polaritons and Leaky Waves. Surface polaritons exist at frequencies between 250 GHz and a few THz when propagating on antiferromagnets. They have been predicted theoretically and observed recently on MnF<sub>2</sub> in reflection measurements. Although damping is necessary for coupling between the surface polariton modes and incident light waves, theoretical studies have not examined the effect of damping on the surface polariton modes. An analysis of the surface polariton modes, with damping, is done by solving the dispersion equation and by studying the classical electromagnetic Green's functions for a semi-infinite antiferromagnet. Sodium Lidar Studies of the Horizontal Variability of Gravity Waves in the Mesosphere: A data analysis technique for determining gravity wave intrinsic parameters is presented. The intrinsic parameters include the horizontal and vertical wavelengths, period, and wave propagation direction. The technique involves measuring the altitude variations of the wave induced density perturbations in the mesospheric Na layer. Lattice Structures in the Image Algebra and Applications to Image Processing: The research is concerned with the investigation of an algebraic

structure, known as image algebra, which is used for expressing algorithms in image processing. (jhd)

ABSTRACT: (U) Residual stresses in symmetric cross-ply laminates were monitored by measuring the dimensionless curvature. The cooling rate was found to have a significant influence on the amount of residual stress in graphite/PEEK (APC-2) laminates. The transverse strain due to crystallization was not negligible and must be considered when predicting residual stresses for cooling rates of 75 deg C/min and lower. The stress-free temperature for 03/90(3) APC-2 laminates decreases with increasing cooling rate. Successive unconstrained heating/cooling provided the necessary environment for less stress relaxation allowing the specimens to move toward an equilibrium stress-free temperature (SFT) of 328 deg C. The SFT for any heating cycle was found to be equivalent to the previous cooling cycle SFT. The SFT is strongly dependent on geometrical constraint during thermal cycling because of the stress relaxation. Keywords: AS4/PEEK Composite, Laminates, SFT, Thermoplastic matrix composites. (jg)

## UNCLASSIFIED REPORT

ABSTRACT: (U) Progress is reported on a study of a new turbulence simulation technique based on an unaveraged, additive decomposition of the Navier-Stokes equations. The decomposition provides a natural separation of the governing equations into large- and small-scale parts, with the small scale solved on local subdomains to provide a high degree of parallelism. Results presented here include formal consistency and accuracy proofs for Burgers' and the full 3-D, incompressible Navier-Stokes equations, as well as various details of transferring information between the large- and small-scale calculations. Initial work on applying the method to the study of transition to turbulence in circular pipe flow is also documented. In addition, studies on the domain decomposition and multigrid aspects of the method, using the Schwarz alternating method and the full-approximation scheme, is included. Keywords: Turbulence simulation, Navier Stokes equations, Additive decomposition, Large eddy simulation, Burgers equations. (Jhd)

SUPPLEMENTARY NOTE: Pub. in Langmuir, v6 p974-979 1990.

ABSTRACT: (U) Adsorption of pyridine on smooth polycrystalline gold was studied by the use of the radioactive-labeling method and electrochemistry. The adsorption is reversible and, in the range of the structural uniformity of the adsorbate, characterized by the standard Gibbs energy of adsorption of 30 Kilojoules per mole. Weak repulsive interactions between vertically adsorbed pyridine molecules were found. At low bulk concentrations of the adsorbate, a horizontally oriented pyridine occupies the surface and rearranges to the vertical form with the increase in the electrode potential. The contrasting cases of pyridine adsorption on gold from acidic and neutral solution and differences encountered in bonding of pyridine by polycrystalline gold and platinum are discussed. Keywords: Reprints, Surface properties, Organic compound, Organic base, Transition metals, Aromatic ring, Nitrogen, SERS. (JG)

ABSTRACT: (U) We have measured the temperature dependence of the collision-induced quenching rate constant for NH(a1 delta) with the collision partners Nitrogen, Carbon Monoxide, Oxygen, and Xenon. As expected, quenching by CO and Xe is temperature independent with quenching cross sections of 1.9 and 1.5 A<sup>2</sup>, respectively. Keywords: Electronic quenching, Imidogen, Fabrication metallurgy, Reprints, Singlet ammonium radical. (jg)

ABSTRACT: (U) The microscopic structural and electronic properties of the charge density wave (CDW) phases in a series of iron-substituted tantalum disulfide materials, Fe(x)Ta(1-x)S<sub>2</sub>, have been characterized using scanning tunneling microscopy (STM). On average, the incommensurate CDW phase exhibits a regular hexagonal superlattice for x(Fe) < or = 0.02. At the atomic level, however, analysis of real-space STM images shows that there are well-defined defects in this CDW structure. The frequency and size of the defects depend directly on the concentration of iron. Furthermore, atomic resolution images demonstrate that these defects involve a spatially localized CDW amplitude distortion or coupled amplitude-position distortion. For x(Fe) > or = 0.04 the CDW superlattice exhibits large distortions in the wavelength and amplitude. The distortions in the CDW structure have been characterized as a function of iron concentration using real-space wavelength measurements and two-dimensional Fourier transform power spectra of the images. These results resolve the source of differences between STM and previous diffraction studies of metal-substituted tantalum disulfide, and also indicate that above a critical concentration of iron the properties of the CDW

ABSTRACT: (U) Adsorption of sulfate/bisulfate anions was studied on a smooth gold electrode by the use of the radioactive labeling method. Adsorption is reversible with respect to the bulk concentration of adsorbate and the electrode potential. The chemical component in adsorption is weak, as assessed from an almost linear relationship between surface concentration and the electrode potential. This indicates that the surface attachment occurs predominantly through electrostatic interactions between the surface and the ions, which were concluded to be bisulfate anions. Processing the radiochemical information using the Bennes adsorption isotherm yields basic thermodynamic magnitudes, such as standard Gibbs energy of adsorption and the interaction energy. Their analysis reveals that in the studied bulk concentration range a strong interionic repulsion limits the uptake of anions to ca. 30% of a maximum coverage. UNCLASSIFIED REPORT

ABSTRACT: (U) This report has focused on the development of mathematical techniques to understand unstable physical processes with particular emphasis on dynamic behavior in fluids, plasmas, and multi-particle systems. The particular focus has been on the development of singular perturbation techniques to study amplitude equations arising in hydrodynamic stability theory, in particular the Ginzburg-Landau equation of fluid dynamics and the Zakharov equation of plasma physics. Two successful approaches have been developed to these problems. The first is directed at studying branching and bifurcation processes near nonlinear plane waves and the second approach focused on the singular (NLS) limit of the Zakharov system governing plasma turbulence. Keywords: Perturbation theory; Hydrodynamic configurations; Mathematics. (cp)

UNCLASSIFIED REPORT

ABSTRACT: (U) The focus of this research is to investigate and develop methodologies for the integration of optimization, human interactions, simulation, and knowledge base to address the problems of scheduling transportation networks. These four techniques have been traditionally applied in isolation when addressing scheduling problems, resulting in serious modeling limitations. However, the complementary strengths of these techniques suggest a synthesis that would provide dramatic improvement in the ability to solve these problems. We have developed a prototype model that demonstrates the novel power and benefit of this integration. The concept and methodologies have been tested and proven successful. Transportation networks are the fundamental structures associated with the movement and storage of material. The basic elements of the transportation networks include material movement requirements, transportation vehicles, points (facilities for supplying and receiving movement requirements), links (relationships between points), and crews. Through the generalization of the transportation network structure, a large variety of logistics problems can be modeled in the same fashion, bearing similar mathematical properties, and can be studied and solved in a disciplined (as opposed to ad hoc) manner. (KR)

UNCLASSIFIED REPORT

ABSTRACT: (U) A quadratic eigenvalue problem with symmetric positive definite coefficient matrices may be reduced to linear form while retaining symmetry in the new coefficients but neither of them will be positive definite. Formally the symmetric Lanczos algorithm and subspace iteration may be used to compute some eigenpairs of the linear problem. The trouble is that the basis vectors are orthogonal with respect to an indefinite inner product so there is no assurance that they will be linearly independent. Nevertheless this is an attractive way to solve the original problem and we discuss how to implement it and how it relates to the unsymmetric Lanczos procedures. We discuss complex origin shifts, reorthogonalization, and error bounds. Several methods for solving the reduced problem are mentioned but we have no fully satisfying technique. Some dangers are described and examples are given comparing our Lanczos program with a modified subspace iteration. ABSTRACT: (U) Architectures for optical symbolic computing were designed, devices were designed and built that were specifically for the architectures, and test circuits for some of the logic elements were designed, constructed, and operated. The research elements were designed, constructed, and operated. The research led to novel architectures for optical symbolic computing. Devices were developed that are suitable for optical 2-D memory and logic. These devices are pixilated photo-addressed spatial light modulators (SLMs) with a three-terminal arrangement so that the threshold can be adjusted. Spinoff non-pixilated devices are useful as high frame rate, high-resolution SLMs that can be used for many optical signal processing applications. Keywords: Optical computing; Artificial computing; Artificial intelligence; Symbolic logic; Optical processing; Spatial light modulators. (jhd)

ABSTRACT: (U) We describe an extended model of backward propagation incorporating gain modification and compare the performance of the extended model with ordinary backward propagation. We also describe our work on a statistical model for feature extraction based on the BCM neural network model. The model is presented as an exploratory (PP) (Projection Pursuit) algorithm. The formulation, which is similar in nature to PP, is based on a minimization of a cost function over a set of parameters, yielding an optimal decision rule under some norm. A new projection index (cost function) was presented that favors directions possessing multi-modality, where the multi-modality is measured in terms of the separability property of the data. The synaptic modification equations, which perform the minimization of the cost function, turn out to be similar to the synaptic modification equations governing learning in BCM neurons. ABSTRACT: (U) The important issue of how the superconducting transition temperature  $T_c$  in disordered system changes near the M-I transition where strong localization ( $k$  sub F 1 about 1) is expected has been studied in the Mo-Ge system. In the high Mo concentration, which is in the weakly localized regime,  $T_c$  decreases linearly with decreasing Mo concentration. In this region the ratio of electron-phonon coupling constant  $\lambda$  to the bare density of states  $N$  sub b(0) is constant, which is consistent with the Varma-Dynes tight-binding model. An extrapolation of the linear behavior of  $T_c$  in this regime yields the disappearance of  $T_c$  near 35 at. % Mo. Superconductivity in very thin films of niobium has been investigated. By use of the ion gun which has been installed in the evaporator it has been possible to identify 3 separate mechanisms which contribute to the reduction in  $T_c$  as the film thickness is decreased, namely lifetime broadening, proximity effect and localization. A small single grid ion source has been constructed in order to promote the growth of metastable films at low temperatures. Process has been made on a new ultra high vacuum M.B.E. evaporator. (JHD)

ABSTRACT: (U) Weighted integrals of random processes are approximated by the trapezoidal rule based on a stratified and symmetrized random sample of size  $n$ . The weight functions are assumed to be twice continuously differentiable. We consider the rate of convergence to zero of the mean-square integral approximation error as the sample size increases indefinitely. For random processes which are twice mean-square continuously differentiable it is shown that the rate is  $N$  to the minus 5th power, just as without a random component. For random processes which are a bit more than once, but not twice, mean-square continuously differentiable the rate is shown to be  $N$  to the minus 4th power. In both cases the asymptotic constant is also determined. (KR)

ABSTRACT: (U) We describe an ultra-high resolution technique for recording evoked potentials (EPs) that are thousands of times smaller than the total EEG power. We report that two superimposed visual stimulus patterns, one modulated at F1Hz and the other F2Hz, can generate 20 or more EP frequency components, each of which is contained within a bandwidth of no more than 0.004 Hz. We have developed a theoretical method for calculating the amplitudes and phases of these various cross-modulation components for different arrangements of model neurons. The relative amplitude of the various cross-modulation components seems to be a 'signature' of the particular neural model and this offers a way of testing theoretical neural models against EP data. As an illustration we compare the nonlinear EP components evoked by dichoptic stimulation with unpatterned flickering light against several models of binocular interaction. These nonlinear interaction terms may offer a means of investigating binocularity in amblyopic children or infants who have low acuity in one or both eyes. Canada. Reprints. (JES)

UNCLASSIFIED REPORT

ABSTRACT: (U) A burgeoning discipline of transition-metal inorganic and organometallic chemistry involves the preparation of solid-state materials via solution methods using molecular precursors. Conventional thermal techniques that typically result in thermodynamically determined products can be circumvented by using this approach. Potential advantages of such procedures include the discovery of low-temperature routes to known solids, the generation of intermediate oligomers or polymers that can be processed with greater efficiency, the utilization of complex, yet volatile, compounds for chemical vapor deposition (CVD), and the synthesis of new, kinetically stable materials. Refractory metal nitrides, a class of materials possessing interesting physical and electronic properties, are limited in scope with respect to related oxides, perhaps as a consequence of the severe conditions used in standard preparative procedures. From this standpoint, the development of solution syntheses to M(x)N(y) solids via inorganic or organometallic precursors represents an intriguing challenge in the materials field. Reported herein are initial efforts based on the ammonolysis of metal alkyls, including a model study that resulted in the formation of a trimeric nitride. With this method, a standard thermal process for the formation of cubic TaN was discovered. This phase has been previously prepared under relatively extreme conditions. Keywords: Reprints, Tantalum nitride, Ammonolysis, Bond

ABSTRACT: (U) Concern over environmental contamination with 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) stimulated research of its toxic actions and underlying molecular events. Various epithelial, epithelial-derived tissues such as liver, and the immune system were identified as major target tissues. A toxic mechanism based upon interaction of TCDD with the Ah receptor and subsequent expression of a pleiotropic response provided an explanation for many reported phenomena. In light of the tissue and subcellular specificity of TCDD action, tissue distribution of a given dose likely has substantial effects on patterns of tissue damage. Further, chronic toxicity of repeated low doses may be influenced by factors which increase or decrease TCDD concentrations to which particular cell types are exposed. Reprints. (JES)

ABSTRACT: (U) A description of equipment purchased under an AFOSR equipment grant is provided. This equipment is being used to extend the capabilities of the existing MTS servohydraulic axial-torsional testing machine to allow high precision tests on hollow cylinder soil specimens at constant mean stress levels, especially for specimens undergoing very small strains. The principal equipment items acquired are a computer based data acquisition and control system, a new hollow cylinder triaxial cell, a number of transducers and associated electronics, and mechanical hardware, including a new hydraulic power supply. In addition, several equipment items have been acquired with the RPI matching funds for the existing 100 g-ton geotechnical centrifuge, including a container for holding models during testing and a fork lift for model transport. Keywords: Laboratory/test equipment; Soil mechanics; Hollow cylinder tests; Data acquisition and control system; Geotechnical centrifuge; Soil dynamics. (edc)

ABSTRACT: (U) Several issues in using parallel  
processing for image understanding are addressed. First,  
efficient schemes for parallel image array access are  
developed. New class of latin squares called perfect  
latin squares are defined. Several construction methods  
are shown and some useful properties of such squares are  
identified. A generic parallel model of computation  
employing electro optical devices is developed. Parallel  
techniques for image computations are developed on this  
model. Finally, processor time optimal solutions to  
several low and intermediate level image understanding  
tasks are designed on orthogonal access parallel  
architectures. Keywords: Parallel architectures; Parallel  
algorithms; Latin squares; Image understanding; Array  
access; Processor time; Optimal solutions; Image

ABSTRACT: (U) Effect of Dosing Vehicles on the Pharmacokinetics of Orally Administered Carbon Tetrachloride in Rats. The primary objectives of this investigation were to determine whether oil and aqueous dosage vehicles alter the pharmacokinetics of orally administered carbon tetrachloride (CCI4) in rats, and to relate vehicle effects on CCI4 absorption and bioavailability to alterations of the acute hepatotoxicity of CCI4 seen in a companion study. Fasted 200- to 230-g male Sprague-Dawley rats with indwelling arterial cannulas received 25 mg CCI4/kg body wt by gavage; in corn oil; As an Emulphor aqueous emulsion; in water; and as pure undiluted chemical. ABSTRACT: (U) Although carbon tetrachloride (CCl<sub>4</sub>) is of concern as a drinking water contaminant, it has been necessary in most oral toxicity studies to give CCl<sub>4</sub> in an oil vehicle due to its limited water solubility. The primary objective of our study was to assess the influence of dosing vehicles on the acute hepatotoxicity of CCl<sub>4</sub>. Fasted 200- to 230-g rats. A time-course study revealed that corn oil did not delay the onset or time of maximal liver injury by an oral 100 mg/kg dose of CCl<sub>4</sub>, but did reduce the extent of injury relative to that when the chemical was given undiluted or as an aqueous emulsion. Fasted 200- to 230-g male Sprague-Dawley rats were given 0, 10, 25, 50, 100, 250, 500, or 1000 mg CCl<sub>4</sub>/kg body wt by gavage: in corn oil; as an aqueous emulsion; as the undiluted chemical; and in the 10 and 25 mg/kg doses only, in water. UNCLASSIFIED REPORT

ABSTRACT: (U) This paper primarily concerns the estimation of tail parameters for the marginal distribution  $F$  of the terms of a strongly mixing stationary sequence when  $1-F(t)$  decreases exponentially, or is regularly varying as  $t$  infinity. The asymptotic properties of the Hill estimator for the exponential parameter or regular variation index are developed within this framework. Estimation procedures are investigated for tail probabilities and tail quantiles, both for the individual terms of the process and for their maxima over groups of consecutive terms. The latter case requires estimation of the so called extremal index, and substantially involves the local dependence structure of the sequence. (kr)

819 1989.

ABSTRACT: (U) Visual fields for oscillatory motion in depth were recorded for 21 subjects. Near fields were different from far fields in 8 and similar in 11 subjects. Visual fields for unidirectional motion in depth were recorded for 16 subjects for near and far disparities. Some subjects had fields that differed for approaching versus receding motion in depth and/or for near versus far disparities. In particular, for near disparities, approaching versus receding motion gave fields that were different in 5 and similar in 7 subjects; for far disparities, approaching versus receding motion gave fields that were different in 1 and similar in 10 subjects. For approaching motion in depth, near fields differed from far fields in 3 and were similar in 8 subjects; for receding motion in depth, near fields were different from far fields in 5 and similar in 8 subjects. Because sensitivity to monocular frontal plane motion showed no irregularities corresponding to the stereomotion field defects, we conclude that (1) stereomotion field defects were chiefly due to defective cortical processing of motion. ABSTRACT: (U) This reprint studies in a unified manner both the class of closed, (Sigma sub u, N) -invariant, and (M,N)-recognizable sublanguages and the class of closed, (Sigma sub u, N)-invariant, and (M, Sigma sub c, N)-controllable sublanguages of a given language L that arise in supervisor synthesis problems of discrete event dynamical systems with partial observations. The supremal element of the former class is often too restrictive, and it is natural to study maximal elements of the latter class. A procedure which computes such a maximal element as a limit of a decreasing sequence of sublanguages of L is presented. Each term of the sequence is shown to be regular if a slightly modified procedure is used. (KR)

## UNCLASSIFIED REPORT

ABSTRACT: (U) Presently, there are many uncertainties in risk assessment of volatile organic compounds (VOCs), due to a paucity of data relevant to human exposure situations. It is unclear whether the relatively large VOC inhalation toxicity data base can be used qualitatively or quantitatively to forecast the consequences of ingestion of the chemicals in food or water. It is also unclear whether the existing VOC oral toxicity data base, which largely consists of bolus gavage studies, is applicable to drinking water hazard evaluation. The objective of our study was to evaluate the influence of route and pattern of exposure on the pharmacokinetics and target organ toxicity of carbon tetrachloride (CCl<sub>4</sub>). Male Sprague-Dawley rats of 350-400 g inhaled 100 or 1000 ppm CCl<sub>4</sub> for 2 hr through a one-way breathing valve. (jes)

SUPPLEMENTARY NOTE: Pub. in Proceedings of the  
International Symposium of the Northern Eye Institute (3rd)  
Manchester, UK, 9-13 Aug 87.

ABSTRACT: (U) An influential idea, first suggested by  
the Cambridge University group, is that the spatial  
aspects of retinal image information-pass through  
parallel psychophysical channels, each of which is tuned  
to orientation and spatial frequency. This idea has had  
considerable success in explaining psychophysical data on  
the ability to distinguish between a grating pattern and  
a patch of light of the same mean luminance, i.e. grating  
detection. The spatial frequency bandwidth of the  
channels has been estimated at about 1.4 octaves, and the  
orientation bandwidth at 10-20 deg. It is often supposed  
that these channels are the psychophysical reflection of  
the orientation and spatial frequency tuning of visual  
pathway neurons, and many authors have noted the rough  
agreement between the channel tuning bandwidths and the  
orientation tuning and spatial frequency tuning  
bandwidths of the most sharply-tuned cells in monkey V1  
visual cortex. Reprints.

SUPPLEMENTARY NOTE: Pub. in Americal Chemical Society, Symposium Series No. 243, p165-183 1984.

ABSTRACT: (U) Amine cured epoxy networks were investigated to determine the effect of cross-link density on fracture toughness and other properties. Two series of networks were studied: the first having  $M_c$  (the average molecular weight of a network chain) controlled by the amine/epoxy reactant ratio; the second controlled by the average molecular weight of several homologous difunctional epoxy prepolymers. Expected topological variations of the first series were confirmed by  $T_g$  differences and soluble fractions. The second series was presumed to display only  $M_c$  variations. Cross-link densities were characterized above  $T_g$  by equilibrium modulus measurements employing rubber elasticity theory. The results indicate that this method yields surprisingly reasonable values. Glassy fracture energies of both network series showed an  $M_c$  dependence when ductile yielding of the crack tip preceded crack propagation. (JES)

UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Pub. in Jnl. of Chemical Physics v92  
n9 p5311-5318, 1 May 90.

**ABSTRACT:** (U) The rates and dynamics of three-body thermal recombination of silicon atoms to form dimers is investigated at temperatures of 800, 1000, and 1200 K with Ar and Si atoms acting as the third body. A previously reported global potential-energy surface fitted to the results of ab initio calculations at the MP4/6-31G+ level and experimental data are employed for the (Si, Si, Si) system. A simple, pairwise potential is used for the (Ar, Si, Si) system. The weak temperature dependence is characterized by an activation energy of 1.2 kcal/mol. When silicon is the third body, the rates are more than an order of magnitude larger due to the increased interaction and the opening of a complex formation, channel for recombination. Four mechanistic pathways leading to recombination are identified. These are direct energy exchange, direct atom exchange, complex formation, and metastable formation due to a rotational barrier. For the (Si, Si, Si) system at 800 K, the contributions of these pathways to the total recombination rate are: direct energy and atom exchange (65.5%), complex formation (8.5%), and metastable formation (28%). Internal energy distributions for product Si2 dimers are reported. In every case, these distributions exhibit a prominent maximum at the Si2 dissociation threshold. The falloff at energies below the

AD-A223 455

AD-A223 455

UNCLASSIFIED

PAGE 329

EV1268

AD-A223 455 CONTINUED

maximum reflects the expected exponential distribution of translational energies in unimolecular dissociation processes. The distributions for the (Si, Si, Si) system are broader than those obtained when Ar is the third body. This increased breadth is interpreted to be due to the increased interaction and complex formation that is not present for the (Ar, Si, Si) system. Reprints. (Jhd)

UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Pub. in Langmuir v6 p970-973, 1990.

ABSTRACT: (U) The adsorption of pyridine on a polycrystalline platinum electrode was measured by using a radioactive-labeling technique. The potential dependence and concentration dependence of adsorption were measured in 0.1 M HClO<sub>4</sub> and two exchange experiments were performed. The potential dependence revealed behavior typical for a strongly adsorbed organic species; a broad plateau of maximum adsorption occurs in the double-layer region with decreased adsorption toward potential extremes. No exchange of surface species with added unlabeled solution pyridine occurred at 0.2 V (vs Ag/AgCl, M Cl<sup>-</sup>), but slow exchange was observed at 0.2V over about 2 h; slow hydrogenation is the most likely cause of the loss of adsorbate at this potential. Two different concentration dependence profiles were observed depending on the treatment of the platinum electrode surface; a clean surface gave consistently higher packing densities as a function of pyridine concentration than one that had been pretreated at 0.00001 M. The observed packing densities correspond to horizontally oriented pyridine, formed at low concentrations, and vertically oriented pyridine, formed at high concentrations. Reprints. (JHD)

ABSTRACT: (U) A variety of experimental techniques (multinuclear NMR, Raman, fluorescence polarization, small-angle neutron scattering, viscosity, turbidity, static and dynamic light scattering experiments) have been employed to investigate the nature of the sol-gel transition of tetramethoxysilicate  $\text{Si}(\text{OCH}_3)_4$  (TMOS). These experiments probe changes in structural and dynamical properties at the macroscopic and microscopic levels in the course of the sol-gel transition. The experimental results are compared with recent theories for the gelation process. The experiments show that no drastic change in structure occurs at the gelation threshold of TMOS. The formed silica network exhibits a self-similar structure, and the gross features of the sol-gel transition of TMOS can be described within the framework of percolation theory. The underlying growth process might be classified as reaction-limited cluster-cluster growth. However, the detailed chemical structure and reactivity of the reactants, e.g., the time-dependent functionality of the monomers during the hydrolysis step, also play an important role and have to be taken into account for a more quantitative theoretical description

ABSTRACT: (U) The contract has supported an extensive programme of atmospheric and ionospheric modelling, aimed at examining Atmospheric Structure and Variability, using the CRAY XMP-48 and the CRAY 2S machines. A technique of forcing tidal and other natural atmospheric fluctuations at the lower boundary of the present version of the 3-dimensional, time-dependent global thermosphere-ionosphere model has been developed. Also, a series of numerical studies have been carried out into the modelled response of the thermosphere during a series of geomagnetic storms in 1981 and 1982, observed by the Dynamics Explorer-2 spacecraft. Further studies have concentrated on using these models for studies of thermosphere-ionosphere coupling, atmospheric density, lower atmospheric tides, participation in the analysis and interpretation of empirical data obtained during the 'Lower Thermosphere Coupling Study', the mid- and low-latitude ionospheric effects of geomagnetic storms, and for studies of the solar activity and geomagnetic activity causes of variations of lower thermospheric atomic oxygen and nitric oxide densities. ABSTRACT: (U) This grant is for instrumentation of a laser system for use in developing a new type of atomic trap, an atomic hydrogen trap that operates in the microkelvin regime. The laser system is designed to provide radiation at 243 nm in order to drive the 1S to 2S two-photon transition in atomic hydrogen. The system is based on a Coherent Model 699-21 Dye Laser, that is driven by a Model 200-K3 krypton ion laser. This generates 488 nm radiation which is frequency doubled in an external ring cavity. The system has been assembled and successfully operated. It delivers 5 mW of 243 nm radiation, which is, to our knowledge, a new record. The laser has been stabilized against cavity with a spectral noise of less than 2Hz. The laser system purchased under this grant is a vital component of our program to study hydrogen at ultra low temperatures, and also to carry forward laser spectroscopy to new regimes of precision. ABSTRACT: (U) The self-diffusion coefficients, densities, and shear viscosities of liquid 2-ethyl-hexyl cyclohexanecarboxylate (EHC) were measured as a function of pressure from 1 to 4500 bar within the temperature range from -20 to 80 deg C. The Stokes-Einstein equation is applicable over 5 order of magnitude changes in self-diffusion and viscosity. The experimental data obtained are compared to those for the complex liquid of 2-ethylhexyl benzoate (EHB) in order to characterize the molecular structure effect of the replacement of the benzene ring with a saturated cyclohexyl ring. In particular, the low-temperature data suggest that conjugation of the phenyl ring with the ester group in EHB slows down diffusion and increases viscosity in comparison with EHC. Analysis in terms of the rough hard sphere model indicates a high degree of rotational-translational coupling which increases as density increases. Keywords: Diffusion, Viscosity, High pressure, NMR, Hydrodynamic equation, Viscous fluids, Reprints, EHC, EHB, Organic compounds, Liquids, Molecular properties, Carbon atoms. (JG)

ABSTRACT: (U) An electronically controlled, hydraulically actuated multiaxial mechanical testing system has been purchased from MTS and installed in the Peterson Laboratory at Stanford University. The instrument is controlled by a DEC computer. This instrument provided by the grant will permit a kind of mechanical testing to be done at Stanford University. Multiaxial mechanical tests can be done by using the combined tension-torsion capabilities of the new instrument. This will permit not only a more complete investigation of the mechanisms of deformation and fracture than can be done with axial testing alone but also a study of structural material behavior under the complex loading conditions which arise in practice. The torsional testing mode will also permit studies of deformation at large strains, such as those which arise in metal forming operations. (Cp)

UNCLASSIFIED REPORT

ABSTRACT: (U) Experimental work emphasized demonstrating the use of high resolution frequency domain nonlinear laser spectroscopy for the study of materials, particularly semiconductor heterostructures. The work has demonstrated that cw four-wave mixing spectroscopy provides new information regarding the origin of the nonlinear optical response in semiconductor materials as well as new information about structure and relaxation. A summary of the current progress shows: (1) First experimental observation of an interference effect in the nonlinear optical response in GaAs quantum well structures corresponding to a slow component in the nonlinear optical response. The interference effect is evidence that the exciton resonance frequency is shifted in the presence of the electron hole plasma produced by the ionized exciton. (2) Demonstration of frequency domain nonlinear optical spectroscopy methods for the direct measurement of the ambipolar diffusion coefficient and the electron-hole recombination rate in GaAs quantum well structures. (3) Measurement of the response time in strained quantum well structures where the heavy and light hole exciton overlap in energy. and (4) Use of precision nonlinear optical spectroscopy methods for the study of phonon induced spectral diffusion of the heavy

ABSTRACT: (U) Common epoxy thermosets are glassy at ambient temperatures and are characterized by a densely crosslinked microstructure. Under normal use conditions they generally fail by brittle fracture mechanisms. The influence of network microstructure on glassy fracture is largely undetermined in spite of a sizeable literature. This can be attributed to a lack of studies on structurally characterized networks and the often complicated microstructure of typical epoxy systems. To address these problems we examine structure-fracture relationships in simple epoxy systems whose structural variables are systematically controlled. Densely crosslinked networks may be characterized by equilibrium modulus measurements above Tg. Application of rubber elasticity theory yields very reasonable average network chain molecular weights (Mc); surprising in view of the expected non-Gaussian character of short epoxy network chains. Rubbery fracture energy increases with Mc when compared at equivalent temperatures above Tg. (JES)

ABSTRACT: (U) Electron precipitation occurring at latitudes near the midnight trapping boundary was measured remotely with a satellite-borne x ray imager (> 21 keV). This investigation has demonstrated for the first time the repetitive mapping of precipitation at the trapping boundary with x rays. The satellite spin motion (5.5 second period) provided repeated scans of each scene during a single pass of the satellite. When the in situ electron precipitation, measured directly with a spectrometer (>68 keV) on the same satellite, was limited to a narrow region at the trapping boundary the precipitation inferred from the x rays was generally fairly uniform over a median longitude interval of at least 45 deg. Significant decreases in x rays at longitudes away from the satellite crossing seldom occurred, but significant increases at certain longitudes were sometimes observed. The widespread arc patterns of the precipitation have important implications for both understanding the nature of the responsible loss mechanisms and for assessing the atmospheric effects. Reprints. SUPPLEMENTARY NOTE: Pub. in Combustion and Flame, v79  
p340-365 1990.

ABSTRACT: (U) Direct numerical simulations of turbulence are used to examine the straining on material surfaces, and the behavior of thin diffusive layers. The results are related to questions arising in the study of turbulent premixed and diffusion flames in the flamelet regime. The simulations are of constant-density, homogeneous, isotropic turbulence, with artificial forcing of the velocity field to maintain statistical stationarity. Taylor-scale Reynolds number up to 93 are achieved. It is found that the total rate-of-strain in the tangent plane of a material surface is positive (i.e., extensive) with 80% probability. This straining causes the area of the surface to double every 2.5 Kolmogorov time scales  $\tau_{\text{sub}}$  etc. A premixed flamelet can be viewed as a surface that propagates at a speed  $w$  (i.e., the local laminar flame speed) relative to the fluid ahead. It is shown that the distance  $z$  between such a propagating surface and an initially coincident material surface remains small if  $w$  is small compared to the Kolmogorov velocity scale. For this case, the statistics of  $z$  are characterized. Subject to certain assumptions, the thin diffusive layers between blobs of fluid of different concentration adopt a self-similar form (at least for

ABSTRACT: (U) From a very simple representation of the integrand in the integral representation of a martingale, we derive an integration by parts formula. This is used to give a new proof of the existence of a density of a diffusion process under the hypothesis that the inverse of the Malliavin matrix is in some  $L^p$  sub  $p$ -space, a result implied by Hormander's condition H1. Following Malliavin's original proof of this result there have been other approaches to what is now known as Malliavin's calculus, including those of Stroock, Shigekawa, Bismut, Bichteler and Fomken, and Norris. The main simplification in this paper is the observation that no infinite dimensional calculus of variations is required. This calculus can be replaced by ordinary differentiation in finite dimensional spaces. (KR)

ABSTRACT: (U) Response asymmetry (e.g. to light ON vs. OFF), a frequently encountered property of neurons at both peripheral and central levels in sensory pathways, can be modelled as a rectifier. We describe a double Fourier series method for obtaining the amplitudes and phases of these components for physiologically relevant neural models including (1) compressive, linear, accelerating and mixed compressive/accelerating single model neurons, (2) a cascaded series of model neurons and (3) the parallel/cascaded case corresponding to dichoptic or dichotic stimulation. If one of the inputs is held constant while the other's amplitude is varied, we obtain a family of curves-one for each component. The family of curves seems to be characteristic of the particular nonlinear system. Neural models may be tested by first calculating the family of curves and then comparing these theoretical data with a physiologically measured family of curves. (jes)

UNCLASSIFIED REPORT

ABSTRACT: (U) Studies emphasizing the effects of fuel concentration and operating pressure on the formation of soot particles have been conducted in a series of laminar diffusion flames. These experiments have shown that fuel concentration has a measurable effect on the amount of soot formed in the flame. However, a simple, constant proportionality between the fuel concentration and soot volume fraction has not been found to apply for the range of flow conditions studied. This observation is believed to be a result of flame residence time and diffusion effects which mitigate the consequences of reduced initial fuel concentration. Comparisons with simple laminar diffusion flame models are currently being used to investigate the relationship between initial fuel concentration and local flame concentration fields. Similar studies of soot formation in laminar diffusion flames as a function of operating pressure have also been completed for ethene, ethane and propene fuel species. Keywords: Soot formation, Soot particles, Diffusion flames. (JES)

ABSTRACT: (U) In an effort to organize the design of polymeric materials, we have devised guidelines for analytically modeling the behavior of such materials as function of two independent variables such as rate and temperature. The parameters of successful models should have physical significance in terms of molecular theories or other measurements, and may be optimized by least-squares fits to appropriate data. Specimens may be compared by studying the variations of the fitted model parameters with sample constitution or preparation. We describe the implementation of this procedure on a computer graphics facility, and illustrate its use in the analysis of tear energy in filled polybutadiene networks. We envision an extension of this methodology to permit quantitative prediction of ingredients and treatment needed to produce materials of desired properties. Reprints. (JES)

SUPPLEMENTARY NOTE: Pub. in Polymer, v31 p627-630 1990.

ABSTRACT: (U) Organic polymeric systems are emerging as an important class of optical materials for photonics applications. Polymeric systems offer two main advantages. First, their flexibility to be fabricated in forms of films or fibres of optical quality makes them suitable for integrated-optics device structures. Secondly, conjugated polymeric structures exhibit large non-resonant (non-absorptive) third-order optical non-linearity, which leads to intensity dependence of refractive index. This intensity dependence of refractive index is what forms the basis for ultrafast all-optical switching and optical processes in polymers, therefore, is at the forefront of modern research because of the prospect of optical processing with speeds in the subpicosecond range. Concentrated efforts are being placed on the measurements of non-linear optical behaviour in organic polymeric materials. Reprints. (JES)

ABSTRACT: (U) The phenomena termed fractoemission was monitored in soda-lime-silica glass specimens during slow crack growth. No electron, ion, or photon signals were detected until crack velocities reached approximately (0.01 meters per second). These observations suggest that the more intense fractoemissions observed during fast fracture are due to dissipation of the excess energy associated with unstable crack growth, but more significantly that fractoemissions are not fundamental to crack propagation in glass. Keywords: Surface chemistry, Structural effects of glass and ceramic materials, Stress corrosion, Physical chemistry. (jg)

ABSTRACT: (U) A spectral code for linear stability analysis has been developed that allows easy adaptation to a large variety of basic flows and stability equations. This code is the basis for extensions to analyze secondary and nonlinear stability in parallel and nonparallel flows. Improved numerical techniques have been developed to reduce the computational demand of secondary instability studies. A new approach to convective instability analysis in nonparallel flows on the basis of parabolized stability equations has been developed for incompressible and compressible flows. Encouraging results have been obtained in the areas of linear, nonlinear, and secondary instability. The code appears as a viable alternative to DNS codes that allows transition simulations at a small fraction of the computational cost. Keywords: Transition; Boundary layers; Stability. (jhd)

ABSTRACT: (U) An extensive study of the micromechanics aspects and size effects associated with strain softening damage due to distributed cracking in brittle heterogeneous materials such as concrete, rocks and ceramics has been carried out and presented in a sequence of publications. The results may be grouped in five categories: (1) Size Effects, (2) Micromechanics Aspects, (3) Nonlocal Continuum Models, (4) Localization Instabilities, (5) Thermodynamic Analysis of Stable Path, and (6) Numerical Implementation of Localization Limiters. The law governing the size effect due to localization of strain softening into a finite size fracture process zone has been formulated, experimentally verified and calibrated. Knowledge of the size effect law has led to a method of determining nonlinear fracture properties on the basis of maximum loads of geometrically similar specimens of different sizes. The concept of a brittleness number characterizing the proximity of response of any structure to linear elastic fracture mechanics has been developed. Extensive experiments have been conducted on concrete, rock and ceramics. (JES)

ABSTRACT: (U) Overhead ionospheric incoherent scatter radar data from Millstone Hill is used to deduce the storm time variations of the thermospheric temperature, O and N2 densities, and F1 region ion composition during the Equinox Transition study of September 17-24, 1984. The measured neutral temperature profile and O density at 400 km altitude is extrapolated to determine O density changes in the lower thermosphere. Using these O densities and the measured electron densities, we deduce the variation of the N2 density. Our initial attempt leads to the deduction of large depletions in both O and N2 in the lower thermosphere. The radar-measured neutral temperatures were contaminated by ion-neutral frictional heating effects during the disturbed periods of the ETS and this served to invalidate neutral density extrapolations made with these temperatures. The height of 50% O+ ion composition in the F1 region and the height of the peak electron density in the ionosphere, are completed and compared. The height of the peak on the distributed days was located in the lower F1 region molecular-ion layer rather than in the F1 region O+ layer. This occurrence has serious consequences for methods of

and Applications, v142 n1 p26-34, 15 Aug 89.

ABSTRACT: (U) Probabilistic solutions of the Cauchy  
problem for Kolmogorov's forward and backward equations  
have been known for many years. Kunita uses stochastic  
flows associated with forward and backward stochastic  
differential equations to write down explicit forms of  
the solutions. In fact he uses both forms simultaneously,  
in that he requires the backward equation for the forward  
process to solve the Kolmogorov backward equation, and  
the forward equation for the backward process to solve  
the Kolmogorov forward equation. In this note we indicate  
how solutions of the Kolmogorov equations can be obtained  
directly by differentiation in the time variable of a  
family of conditional expectations. This is justified by  
differentiating inside the conditional expectation, using  
the properties of stochastic flows. Both the forward and  
backward Kolmogorov equations are considered. As noted  
the conditional expectation is a solution of Kolmogorov's  
equation because the bounded variation term in its semi-  
martingale representation, using the Ito formula, is zero.

ABSTRACT: (U) Necessary conditions are given for a symmetric alpha-stable ( $S(\alpha, 1)$ ) process,  $1 < \alpha < 2$ , to be Markov. These conditions are then applied to find Markov or weakly Markov processes within certain important classes of  $S(\alpha, 1)$  processes: time changed Levy motion, scale mixed Gaussian processes, moving averages and harmonizable processes. Two stationary  $S(\alpha, 1)$  Markov processes are introduced, the right and the left  $S(\alpha, 1)$  Ornstein-Uhlenbeck processes. Some of the results are in sharp contrast to the Gaussian case  $\alpha = 2$ . Reprints. (kr)

ABSTRACT: (U) A major challenge in the development of dispersion-hardened alloys is to produce a high volume-fraction of the fine hardening particles. This challenge has been met through the use of Rapid Solidification Technology (RST). Application of RST to titanium alloys can produce oxide-dispersion-strengthened alloys having large volume-fractions of  $< \text{or} = 100$  nanometers incoherent oxide dispersoids, and in situ composites containing high-modulus whisker/particulate reinforcements. These titanium alloys are a special class of refractory hybrid materials which have low density, yet have the high-temperature strength and stability required for use as hypersonic aircraft skins and structures. Oxide dispersions in RST Ti (Titanium) alloys are produced by Rapid Solidification Processing (RSP) and subsequent annealing of Ti/rare-earth alloys. Rapid solidification significantly increases the solid solubilities of rare-earth elements in Ti. Annealing causes the rare-earth elements to precipitate and scavenge in interstitial oxygen from the Ti matrix, forming rare-earth oxide dispersoids. Keywords: Titanium alloys, Niobium alloys, Hybrid materials, Refractory materials, Rapid solidification processing, Oxide dispersions.

ABSTRACT: (U) The reprint develops the spectral theory corresponding to the various time domain Wold decompositions of a discrete two-parameter stationary second-order random field (ssorf). Appropriate Szego-type error formulas are established. Minimality and interpolability are defined for ssorf's and sufficient spectral criteria for these are derived. Partial results are obtained which help to determine, via spectral methods, some of the multiplicities introduced by Kallianpur and Mandrekar in their time domain analysis of ssorf's. ABSTRACT: (U) The project is a theoretical and experimental investigation into the influence of nonlinearities on flexible structures in the presence of multifrequency parametric and external excitations having independent frequencies and phases and arbitrary amplitudes. The nonlinearities and excitations may appear in the governing equations, or the boundary conditions, or both. The study focused on resonance conditions that produce large and possibly damaging motions. Special attention was given to modal coupling and exchanges of energy. We classified the important resonances and their interactions and devised experiments illustrating the phenomena. Keywords: Dynamic response; Nonlinear effects; Flexible structures; Composites; Modal coupling; Resonances. (jhd)

UNCLASSIFIED REPORT

ABSTRACT: (U) A limitation of the DSMC method is that it does not allow efficient use of vector architectures that are predominate in current supercomputers. A new selection rule for collisions between simulated molecules is developed which is highly compatible with vectorization. The collision-selection rule is shown to give identical results to the DSMC method in predicting shock-wave structure and in predicting the correct mean-free path variation with density and temperature for power-law interactions ranging from hard sphere to Maxwell molecule. Algorithmic improvements beyond those related to vectorization issues alone are also introduced, making possible simulations of single-species, rarefied, 3D hypersonic flows employing 10 million particles and 0.5 million cells. The performance of the algorithm on the Cray-2 ranges from 1 to 2 microseconds/particle/time-step. Roughly 500 to 1000 time-steps are needed to time average the results of a simulation, leading to run times of 2 to 5 hours on the Cray-2 for large problems. UNCLASSIFIED REPORT

ABSTRACT: (U) The general objective of this investigation is to apply the discipline of mechanics to the prediction and description of the long-term behavior of composite materials by developing experimental information, conceptual understanding, and analytical representations of the evolution of the properties of constituent materials and interfaces in composite material systems as a function of (generalized) time during the application of time-variable mechanical, thermal, and chemical loadings. The general approach to this objective is to develop mechanistic representations of the 'state of the material' under those conditions and to join those descriptions with micromechanical descriptions of the 'state of stress' in 'critical elements' to support an estimate of remaining strength, and, thereby, to predict remaining life. We have named this enterprise 'evolution mechanics.' (jes)

ABSTRACT: (U) The work relates to the preliminary development of a comprehensive, multi-level, 3-D magnetohydrodynamic model that seeks to describe the detailed, global interaction of the solar wind plasma and magnetic field with the Earth's geospace. The development of five separate advanced computational submodels of the complete interaction model involves approximately 42,000 lines of Fortran source code. These submodels provide the capability for quantitatively simulating a variety of steady and unsteady phenomena associated with the solar wind-terrestrial environment interaction process to a degree previously unattainable. A number of these new developments have been incorporated into a core interaction submodel that can be structured to work in both a rapid warning mode for spacecraft protection as well as in a detailed scientific analysis mode for fundamental studies. The other submodels developed either simulate similar phenomena of the solar wind-terrestrial environment interaction process as the core interaction submodel but at a higher level of simulation accuracy or simulate additional interaction phenomena. ABSTRACT: (U) Peaks over Threshold models commonly used e.g. in hydrology, assume that peak values of an iid or stationary sequence  $X$  sub  $i$  above a high value  $u$ , occur at Poisson points, and the excess values of the peak above  $u$  are independent with an arbitrary common d.f.  $G$ . Motivation for these models has been provided by Smith by using Pareto-type approximations of Pickands for distributions of such excess values. These works strongly suggest that the Pareto family provides the appropriate class of distributions  $G$  for the POT model. This paper considers the point process of excess values of peaks above a high level  $u$  and demonstrate that this converges in distribution to a Compound Poisson Process as  $u$  approaches limit of infinity under appropriate assumptions. It is shown that the multiplicity distribution of this limit (i.e. the limiting the Pareto family and detailed forms are given for the normalizing constants involved. This exhibits the POT model specifically as a limit for the point process of excesses of peaks and delineates the distributions involved. (kr)

ABSTRACT: (U) Necessary and sufficient conditions for equivalence or singularity of certain product measures are given and applied to the problem of distinguishing a sequence of random vectors from affine transformations of itself. In particular sequences of independent stable random variables are considered and the singularity of sequences with different indexes of stability is proved. Using these results the dichotomy, two processes are either equivalent or singular, is established for certain classes of stable processes, such as independently scattered measures and harmonizable processes. Also sufficient conditions for singularity and necessary conditions for absolute continuity are given for p sub th order processes. (kr)

ABSTRACT: (U) Single point ab initio calculations for  
number of molecules, using various procedures with 3-21G  
or AM1 geometries, show that the AM1-based results seem  
to be better for high level ab initio procedures and for  
studies of reactions, as well as requiring less computing  
time. Current ab initio methods usually give good  
estimates of heats of reaction if a large basis set is  
used and if allowance is made for electron correlation, e.  
g. by Moeller-Plesset (MP) perturbation theory. However,  
calculations of this kind require too much computing time  
to be carried out rigorously, i.e. with full geometry  
optimization, for any but small molecules. It has  
therefore become a standard practice in such cases to  
calculate the geometries by a simple and correspondingly  
cheap method, usually the 3-21G model, and then to carry  
out single point calculations by the high level procedure.  
The same procedure is also commonly used in studies of  
the Transition States (TS) of reactions where the cost of  
calculations by a correlated high level procedure is even  
more forbidding. Reprints. (JES)

ABSTRACT: (U) The NCAR thermosphere general circulation model (TGCM) is used to perform a series of controlled experiments aimed at better understanding the interactive coupling between ionospheric plasma densities and thermospheric neutral winds. The experiments are simple and controlled to facilitate identification of governing mechanisms. The interaction is accomplished by parameterizing the F layer peak height (hmf2) in an empirical ionospheric model in terms of the meridional wind (Vsouth) and forcing hmf2 and Vsouth to remain mutually coupled in a dynamic calculation. Interactive computations are performed where the TGCM is driven by 30-kV and 90-kV cross polar cap potentials and are compared with corresponding reference simulations where hmf2 is constrained to a balance height near 280 km with a small (about 20 km) diurnal variation. Mutual coupling between hmf2 and Vsouth is found to be weak during the daytime night, when the F2 layer exhibits a broad vertical structure. At night, when the F2 layer is more localized, the neutral dynamic structure is dependent on whether hmf2 is significantly above or below the altitude (approximately 275-300 km) at which ion drag effectively competes with viscosity in the neutral momentum balance. At Arecibo during both levels of high-latitude forcing the premidnight elevation (+75 km) of hmf2 relative to a

AD-A222 554 CONTINUED

nighttime height of approximately 290 km is accompanied by an increase (about 50 m/s) in the zonal wind above 250 km relative to the noninteractive simulation. A much smaller effect, characterized by an 8-hour periodicity spanning 24 hours, is seen in the meridional wind component. Ionospheric models; Thermosphere coupling interaction. Reprints. (edc)

ABSTRACT: (U) Colloidal dispersions of uniform spherical particles by zirconium basic sulphate and zirconium oxybasic carbonate were prepared by ageing zirconium sulphate solutions at elevated temperatures in the presence of urea. Different chemical compositions of the above products resulted when the ageing temperature was altered. Depending on the nature of the original solids, calcination at 800 C resulted in the formation of tetragonal or monoclinic zirconia. Under certain conditions a mixed phase, including cubic zirconia, has also been identified. The particle morphology was retained during these transformations. Coprecipitation in mixed solutions of zirconium and yttrium salts aged at 80 C yielded composite spherical particles of basic carbonate with a zirconium to yttrium ratio of the solid similar to that used in the initial solution. UNCLASSIFIED REPORT

ABSTRACT: (U) Residual stresses are developed during processing of composites due to the thermal mismatch between constituents and the chemical shrinkage of the matrix during the crosslinking reaction. Our research has shown that these residual stresses can be high enough to cause ply cracking even before loading. The objectives of the present research were to determine how residual stresses develop during processing, develop a model which would predict these residual stresses, and find an optimization scheme which would reduce the residual stresses induced by processing. The approach taken was to monitor the residual stress development through the curvature measurements in unsymmetric cross-ply specimens. The material system used was a graphite/BMI manufactured by American Cyanamid under the trade name CYCOM 3100(TM). Both elastic and viscoelastic models were used to predict the induced curvature. Mechanical testing and thermal analysis of processed specimens provided the input data for modeling. Drawing from the experimental results and analytical modeling, several cure cycle variations were proposed and investigated to reduce residual stresses. Keywords: Plastics, thermoplastic matrix composite, Peek, Mechanical properties, Crystals, Polymers.

ABSTRACT: (U) The report summarizes results of  
experimental and theoretical investigations into the  
nonlinear response and control of structural elements.  
Methods for the analysis and design of control procedures  
applicable to certain nonlinear distributed parameter  
systems were investigated. Analytical and computational  
techniques were developed for evaluating the nonlinear  
effects on control designs. Bench-type experiments were  
conducted for validating some of the theoretical results.  
Keywords: Nonlinear dynamics; Control; Resonances; Modal  
coupling. (jhd)

ABSTRACT: (U) Under the present study the qualitative  
work performed earlier has been extended to perform  
quantitative calculations of the entry of plasma into the  
magnetosphere. These calculations include the structure  
of the low-latitude boundary layer and the energy  
spectrum of the particles within the plasma sheet. These  
calculations were performed using actual satellite data  
and virtually no assumed parameters. The success of these  
calculations provides impressive evidence for the  
validity of the Gradient Drift Entry theory. It also  
proves that the widely held notion that the magnetosheath  
cannot be the source of plasma sheet particles is in  
error. The success of this study permits the development  
of quantitative models of the magnetosphere required for  
the prediction of magnetospheric and upper atmospheric  
and ionospheric effects on those hardware systems which  
must operate in Earth orbital space. (KR)

ABSTRACT: (U) A diffusion observation process is approximated by a Markov chain. The information obtained by observing the Markov chain is the same as that obtained by observing a related multivariate point process. Filtering and Zakai equations are obtained for multivariate point process observations. These involve Stieltjes integrals rather than Ito integrals with respect to Brownian motion, and so they provide robust formulae, that is, formulae which are continuous in the observation process. (kr)

**ABSTRACT:** (U) In the last several years there has been a remarkable amount of work in probability on infinitely dimensional spaces, in particular on nuclear spaces. Although the most of work has been done in nuclear spaces, some of the basic theorems (for instance, Ito's regularization theorem), are given in a much more general context of multi-Hilbertian spaces. In this paper we study topological properties of multi-Hilbertian spaces and their duals, hoping that this will serve as an introduction to a study of probability problems on these spaces. We tried to clearly distinguish properties that are consequences of nuclearity from those that hold on non-nuclear spaces. In section 5, we propose a non-standard completion theorem, removing the condition of compatibility of norms, a condition that seems to be overlooked in most probability papers in this area. Also, we give a detailed account on open, bounded and compact sets. Elaborated proofs are left for appendices, and, as a result, appendices occupy a considerable space. This is mostly due to results related to seminorms that we wanted to make rigorous. The results that are given in this paper are selected with a purpose to serve as a basis for probability investigation; the topology alone was not the aim. As a continuation of this work, we plan to investigate sigma- algebras and probability measures, and weak convergence of measures in a general context of

ABSTRACT: (U) An H(-) ion source for high brightness H atoms beams should have the lowest possible internal temperature T, because the beam-power density at a distance scales as 1/T. We determine local Temperature inside a discharge with the use of a tunable ArF excimer laser that measures the populations of the lowest four rotational states of H<sub>2</sub> by means of (2+1) resonance enhanced multiphoton ionization (REMPI). The number of laser-created ions causes a proportional change of the discharge's electrical impedance. A calibration in room temperature H<sub>2</sub> (without a discharge) showed that the REMPI works well. Another objective is to monitor vibrationally excited molecules, H<sub>2</sub>(v), that are believed to be the primary origin of H(-) within volume-type ion sources. We use the same apparatus and approach, but add a Raman shifter to change the laser wavelengths to those appropriate for (2+1) REMPI of H<sub>2</sub>(v). Keywords: Neutral beam, Ion source diagnostics, Laser diagnostics, REMPI, Particle accelerator components, Physics. (JG)

ABSTRACT: (U) Research is reported on adaptive time series methods for detecting and tracking both abrupt and slow changes in both structure and parameters of dynamic systems. The methods are based on a unified statistical framework which is motivated by statistical inferences and entropy arguments. The method yields estimates of multivariate input/output dynamics and noise statistics. It also gives estimate of system order that is optimal in the sense of an information theoretic criterion. The integrated approach is known as CVA-AIC. Many theoretical issues have been explored under the scope of this project. The relationship between this technique and another powerful framework for estimation known as E-M algorithmic approach has been established. If the CVA-AIC technique is embedded properly in an E-M framework, it leads to maximum likelihood estimates and recursive algorithms for system identification. (jhd)

ABSTRACT: (U) The major challenge facing sol-gel processing of advanced optical materials, and in fact the entire field of chemically derived ceramics, is to relate processing variables to final properties. Fundamental studies of sol-gel processing science pursued at GELTECH during the last few years have led to two major accomplishments: (1) Development of a generic sol-gel process for producing fully dense silica monoliths (Type V Silica) (2) Development of a generic sol-gel process for producing porous silica monoliths (Type VI Silica). These two materials present many unique properties and offer enormous potential for the development of new optical components and advanced optic systems with unique capabilities. In order to take full advantage of the unique capabilities of the GELSIL process, considerable efforts have been devoted to develop international collaboration in the field of advanced optical systems. This effort lead to the establishment of several research programs in some of the world leader laboratories in the field of advanced optics. These research programs and a summary of results to date are given below. Keywords: Optics, Silica, Porous silica, Mixing, Casting, Aging, Drying, Stabilization, Densification, Organic/inorganic composite, Liquid crystals, Laser, Arrays, Titania. (jes)

SUPPLEMENTARY NOTE: Pub. in Stochastic Analysis and  
Applications, v7 n3 p273-289 1989.

ABSTRACT: (U) The effect of random inputs on a  
continuous piecewise-linear singularly perturbed system  
is investigated in this reprint. Reduced-order models are  
developed for a second-order system (one fast and one  
slow variable) which has a random input. It is shown that  
the solutions of the reduced-order models approximate the  
actual solution with differences in probability density  
functions of order  $O(\mu)$  to the one half power) (in a  
distributional sense). For the special case of a system  
which is linear in the fast variable, it is shown that  
the mean-squared error between the approximate and actual  
solutions in the fast time scale is of order  $O(\mu)$ .  
An outline is provided for the extension of the results  
to the vector variable case. Reprints. (kr)
